

# Package ‘openintro’

July 3, 2020

**Title** Data Sets and Supplemental Functions from 'OpenIntro' Textbooks and Labs

**Version** 2.0.0

**Description** Supplemental functions and data for 'OpenIntro' resources, which includes open-source textbooks and resources for introductory statistics (<<https://www.openintro.org/>>). The package contains data sets used in our open-source textbooks along with custom plotting functions for reproducing book figures. Note that many functions and examples include color transparency; some plotting elements may not show up properly (or at all) when run in some versions of Windows operating system.

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.1.0

**Suggests** broom, dplyr, forcats, lubridate, tidyr, knitr

**Imports** ggplot2 (>= 2.2.1), graphics, rmarkdown, tibble

**Depends** R (>= 2.10), airports, cherryblossom, usdata

**URL** <https://github.com/OpenIntroStat/openintro>

**BugReports** <https://github.com/OpenIntroStat/openintro/issues>

**VignetteBuilder** knitr

**NeedsCompilation** no

**Author** Mine Çetinkaya-Rundel [aut, cre]

absenteeism

*Absenteeism from school in New South Wales***Description**

Researchers interested in the relationship between absenteeism from school and certain demographic characteristics of children collected data from 146 randomly sampled students in rural New South Wales, Australia, in a particular school year.

**Usage**

absenteeism

**Format**

A data frame with 146 observations on the following 5 variables.

**eth** Ethnicity, representing Aboriginal ('A') or not ('N').

**sex** Gender.

**age** Age bucket.

**lrn** Learner status, with average learner ('AL') and slow learner ('SL').

**days** Number of days absent.

**Source**

Venables WN, Ripley BD. 2002. Modern Applied Statistics with S. Fourth Edition. New York: Springer.

Data can also be found in the R 'MASS' package under the data set name 'quine'.

**Examples**

```
library(ggplot2)

ggplot(absenteeism, aes(x = eth, y = days)) +
  geom_boxplot() +
  coord_flip()
```

---

acs12

*American Community Survey, 2012*

---

**Description**

Results from the US Census American Community Survey, 2012.

**Usage**

```
acs12
```

**Format**

A data frame with 2000 observations on the following 13 variables.

**income** Annual income.

**employment** Employment status.

**hrs\_work** Hours worked per week.

**race** Race.

**age** Age, in years.

**gender** Gender.

**citizen** Whether the person is a U.S. citizen.

**time\_to\_work** Travel time to work, in minutes.

**lang** Language spoken at home.

**married** Whether the person is married.

**edu** Education level.

**disability** Whether the person is disabled.

**birth\_qtr** The quarter of the year that the person was born, e.g. 'Jan thru Mar'.

### Source

<https://www.census.gov/programs-surveys/acs>

### Examples

```
library(dplyr)
library(ggplot2)
library(broom)

# employed only
acs12_emp <- acs12 %>%
  filter(
    age >= 30, age <= 60,
    employment == "employed",
    income > 0
  )

# linear model
ggplot(acs12_emp, mapping = aes(x = age, y = income)) +
  geom_point() +
  geom_smooth(method = "lm")

lm(income ~ age, data = acs12_emp) %>%
  tidy()

# log-transformed model
ggplot(acs12_emp, mapping = aes(x = age, y = log(income))) +
  geom_point() +
  geom_smooth(method = "lm")

lm(log(income) ~ age, data = acs12_emp) %>%
  tidy()
```

---

`age_at_mar`*Age at first marriage of 5,534 US women.*

---

**Description**

Age at first marriage of 5,534 US women who responded to the National Survey of Family Growth (NSFG) conducted by the CDC in the 2006 and 2010 cycle.

**Usage**`age_at_mar`**Format**

A data frame with 5,534 observations and 1 variable.

**age** Age a first marriage.

**Source**

National Survey of Family Growth, 2006-2010 cycle, [https://www.cdc.gov/nchs/nsfg/nsfg\\_2006\\_2010\\_puf.htm](https://www.cdc.gov/nchs/nsfg/nsfg_2006_2010_puf.htm).

**Examples**

```
library(ggplot2)

ggplot(age_at_mar, mapping = aes(x = age)) +
  geom_histogram(binwidth = 3) +
  labs(x = "Age", y = "Count", title = "Age at first marriage, US Women",
       subtitle = "Source: National Survey of Family Growth Survey, 2006 - 2010")
```

---

`ames`*Housing prices in Ames, Iowa*

---

**Description**

Data set contains information from the Ames Assessor's Office used in computing assessed values for individual residential properties sold in Ames, IA from 2006 to 2010. See [here](#) for detailed variable descriptions.

**Usage**`ames`

**Format**

A tbl\_df with with 2930 rows and 82 variables:

**Order** Observation number.

**PID** Parcel identification number - can be used with city web site for parcel review.

**area** Above grade (ground) living area square feet.

**price** Sale price in USD.

**MS.SubClass** Identifies the type of dwelling involved in the sale.

**MS.Zoning** Identifies the general zoning classification of the sale.

**Lot.Frontage** Linear feet of street connected to property.

**Lot.Area** Lot size in square feet.

**Street** Type of road access to property.

**Alley** Type of alley access to property.

**Lot.Shape** General shape of property.

**Land.Contour** Flatness of the property.

**Utilities** Type of utilities available.

**Lot.Config** Lot configuration.

**Land.Slope** Slope of property.

**Neighborhood** Physical locations within Ames city limits (map available).

**Condition.1** Proximity to various conditions.

**Condition.2** Proximity to various conditions (if more than one is present).

**Bldg.Type** Type of dwelling.

**House.Style** Style of dwelling.

**Overall.Qual** Rates the overall material and finish of the house.

**Overall.Cond** Rates the overall condition of the house.

**Year.Built** Original construction date.

**Year.Remod.Add** Remodel date (same as construction date if no remodeling or additions).

**Roof.Style** Type of roof.

**Roof.Matl** Roof material.

**Exterior.1st** Exterior covering on house.

**Exterior.2nd** Exterior covering on house (if more than one material).

**Mas.Vnr.Type** Masonry veneer type.

**Mas.Vnr.Area** Masonry veneer area in square feet.

**Exter.Qual** Evaluates the quality of the material on the exterior.

**Exter.Cond** Evaluates the present condition of the material on the exterior.

**Foundation** Type of foundation.

**Bsmt.Qual** Evaluates the height of the basement.

**Bsmt.Cond** Evaluates the general condition of the basement.

**Bsmt.Exposure** Refers to walkout or garden level walls.

**BsmtFin.Type.1** Rating of basement finished area.

**BsmtFin.SF.1** Type 1 finished square feet.

**BsmtFin.Type.2** Rating of basement finished area (if multiple types).

**BsmtFin.SF.2** Type 2 finished square feet.

**Bsmt.Unf.SF** Unfinished square feet of basement area.

**Total.Bsmt.SF** Total square feet of basement area.

**Heating** Type of heating.

**Heating.QC** Heating quality and condition.

**Central.Air** Central air conditioning.

**Electrical** Electrical system.

**X1st.Flr.SF** First Floor square feet.

**X2nd.Flr.SF** Second floor square feet.

**Low.Qual.Fin.SF** Low quality finished square feet (all floors).

**Bsmt.Full.Bath** Basement full bathrooms.

**Bsmt.Half.Bath** Basement half bathrooms.

**Full.Bath** Full bathrooms above grade.

**Half.Bath** Half baths above grade.

**Bedroom.AbvGr** Bedrooms above grade (does NOT include basement bedrooms).

**Kitchen.AbvGr** Kitchens above grade.

**Kitchen.Qual** Kitchen quality.

**TotRms.AbvGrd** Total rooms above grade (does not include bathrooms).

**Functional** Home functionality (Assume typical unless deductions are warranted).

**Fireplaces** Number of fireplaces.

**Fireplace.Qu** Fireplace quality.

**Garage.Type** Garage location.

**Garage.Yr.Blt** Year garage was built.

**Garage.Finish** Interior finish of the garage.

**Garage.Cars** Size of garage in car capacity.

**Garage.Area** Size of garage in square feet.

**Garage.Qual** Garage quality.

**Garage.Cond** Garage condition.

**Paved.Drive** Paved driveway.

**Wood.Deck.SF** Wood deck area in square feet.

**Open.Porch.SF** Open porch area in square feet.

**Enclosed.Porch** Enclosed porch area in square feet.

**X3Ssn.Porch** Three season porch area in square feet.

**Screen.Porch** Screen porch area in square feet.  
**Pool.Area** Pool area in square feet.  
**Pool.QC** Pool quality.  
**Fence** Fence quality.  
**Misc.Feature** Miscellaneous feature not covered in other categories.  
**Misc.Val** Dollar value of miscellaneous feature.  
**Mo.Sold** Month Sold (MM).  
**Yr.Sold** Year Sold (YYYY).  
**Sale.Type** Type of sale.  
**Sale.Condition** Condition of sale.

De Cock, Dean. "Ames, Iowa: Alternative to the Boston housing data as an end of semester regression project." *Journal of Statistics Education* 19.3 (2011).

---

ami_occurrences	<i>Acute Myocardial Infarction (Heart Attack) Events</i>
-----------------	--

---

### Description

This data set is simulated but contains realistic occurrences of AMI in NY City.

### Usage

ami\_occurrences

### Format

A data frame with 365 observations on the following variable.

**ami** Number of daily occurrences of heart attacks in NY City.

### Examples

```
library(ggplot2)

ggplot(ami_occurrences, mapping = aes(x = ami)) +
  geom_bar() +
  labs(x = "Acute Myocardial Infarction events",
       y = "Count",
       title = "Acute Myocardial Infarction events in NYC")
```

---

`antibiotics`*Pre-existing conditions in 92 children*

---

**Description**

Pre-existing medical conditions of 92 children involved in a study on the optimal duration of antibiotic use in treatment of tracheitis, which is an upper respiratory infection.

**Usage**`antibiotics`**Format**

A data frame with 92 observations, each representing a child, on the following variable.

**condition** Pre-existing medical condition.

**Examples**

```
library(ggplot2)

ggplot(antibiotics, aes(x = condition)) +
  geom_bar() +
  labs(x = "Condition", y = "Count",
       title = "Pre-existing conditions of children",
       subtitle = "in antibiotic use study") +
  coord_flip()
```

---

`arbutnot`*Male and female births in London*

---

**Description**

Arbutnot's data describes male and female christenings (births) for London from 1629-1710.

**Usage**`arbutnot`**Format**

A `tbl_df` with 82 rows and 3 variables:

**year** year, ranging from 1629 to 1710

**boys** number of male christenings (births)

**girls** number of female christenings (births)

## Details

John Arbuthnot (1710) used these time series data to carry out the first known significance test. During every one of the 82 years, there were more male christenings than female christenings. As Arbuthnot wondered, we might also wonder if this could be due to chance, or whether it meant the birth ratio was not actually 1:1.

## Source

These data are excerpted from the [HistData::Arbuthnot] data set in the HistData package.

## Examples

```
data(arbuthnot)
```

---

ArrowLines

*Create a Line That may have Arrows on the Ends*

---

## Description

Similar to [lines](#), this function will include endpoints that are solid points, open points, or arrows (mix-and-match ready).

## Usage

```
ArrowLines(  
  x,  
  y,  
  lty = 1,  
  lwd = 2.5,  
  col = 1,  
  length = 0.1,  
  af = 3,  
  cex.pch = 1.2,  
  ends = c("a", "a"),  
  ...  
)
```

## Arguments

x	A vector of the x-coordinates of the line to be drawn.
y	A vector of the y-coordinates of the line to be drawn. This vector should have the same length as that of x.
lty	The line type.
lwd	The line width.
col	The line and endpoint color.

length	If an end point is an arrow, then this specifies the sizing of the arrow. See the length argument in the <a href="#">arrows</a> help file for additional details.
af	A tuning parameter for creating the arrow. Usually the default (3) will work. If no arrow is shown, make this value larger. If the arrow appears to extend off of the line, then specify a smaller value.
cex.pch	Plotting character size (if open or closed point at the end).
ends	A character vector of length 2, where the first value corresponds to the start of the line and the second to the end of the line. A value of "a" corresponds to an arrow being shown, "o" to an open circle, and "c" for a closed point.
...	All additional arguments are passed to the <a href="#">lines</a> function.

**Author(s)**

David Diez

y <- x^2 - 3
points(x, y, col=COL[1], pch=19, cex=1.2)
```

---

ask

*How important is it to ask pointed questions?*

---

### Description

Something is wrong with this data set. In this experiment, each individual was asked to be a seller of an iPod (a product commonly used to store music on before smart phones...). They participant received \$10 + 5% of the sale price for participating. The iPod they were selling had frozen twice in the past inexplicably but otherwise worked fine. The prospective buyer starts off and then asks one of three final questions, depending on the seller's treatment group.

### Usage

ask

### Format

A data frame with 219 observations on the following 3 variables.

**question\_class** The type of question: 'general', 'pos\_assumption', and 'neg\_assumption'.

**question** The question corresponding to the 'question.class'

**response** The classified response from the seller, either 'disclose' or 'hide'.

### Details

The three possible questions: - General: What can you tell me about it? - Positive Assumption: It doesn't have any problems, does it? - Negative Assumption: What problems does it have?

The outcome variable is whether or not the participant discloses or hides the problem with the iPod.

### Source

Minson JA, Ruedy NE, Schweitzer ME. There \*is\* such a thing as a stupid question: Question disclosure in strategic communication.

### Examples

```
library(dplyr)
library(ggplot2)

# Distribution of responses based on question type
ask %>%
  count(question_class, response)

# Visualize relative frequencies of responses based on question type
ggplot(ask, aes(x = question_class, fill = response)) +
  geom_bar(position = "fill")
```

```
# Perform chi-square test
(test <- chisq.test(table(ask$question_class, ask$response)))

# Check the test's assumption around sufficient expected observations
# per table cell.
test$expected
```

---

association

*Simulated data for association plots*

---

### **Description**

Simulated data set.

### **Usage**

```
association
```

### **Format**

A data frame with 121 observations on the following 4 variables.

**x1** a numeric vector  
**x2** a numeric vector  
**x3** a numeric vector  
**y1** a numeric vector  
**y2** a numeric vector  
**y3** a numeric vector  
**y4** a numeric vector  
**y5** a numeric vector  
**y6** a numeric vector  
**y7** a numeric vector  
**y8** a numeric vector  
**y9** a numeric vector  
**y10** a numeric vector  
**y11** a numeric vector  
**y12** a numeric vector

## Examples

```
library(ggplot2)

ggplot(association, aes(x = x1, y = y1)) +
  geom_point()

ggplot(association, aes(x = x2, y = y4)) +
  geom_point()

ggplot(association, aes(x = x3, y = y7)) +
  geom_point()
```

---

assortive_mating	<i>Eye color of couples</i>
------------------	-----------------------------

---

## Description

Colors of the eye colors of male and female partners.

## Usage

```
assortive_mating
```

## Format

A data frame with 204 observations on the following 2 variables.

**self\_male** a factor with levels 'blue', 'brown', and 'green'

**partner\_female** a factor with 'blue', 'brown', and 'green'

## Source

B. Laeng et al. Why do blue-eyed men prefer women with the same eye color? In: Behavioral Ecology and Sociobiology 61.3 (2007), pp. 371-384.

## Examples

```
data(assortive_mating)
table(assortive_mating)
```

---

avandia

*Cardiovascular problems for two types of Diabetes medicines*

---

### Description

A comparison of cardiovascular problems for Rosiglitazone and Pioglitazone.

### Usage

avandia

### Format

A data frame with 227571 observations on the following 2 variables.

**treatment** a factor with levels Pioglitazone and Rosiglitazone

**cardiovascular\_problems** a factor with levels no and yes

### Source

D.J. Graham et al. Risk of acute myocardial infarction, stroke, heart failure, and death in elderly Medicare patients treated with rosiglitazone or pioglitazone. In: JAMA 304.4 (2010), p. 411. issn: 0098-7484.

### Examples

```
table(avandia)
```

---

AxisInDollars

*Build Better Looking Axis Labels for US Dollars*

---

### Description

Convert and simplify axis labels that are in US Dollars.

### Usage

```
AxisInDollars(side, at, include.symbol = TRUE, simplify = TRUE, ...)
```

**Arguments**

side	An integer specifying which side of the plot the axis is to be drawn on. The axis is placed as follows: 1 = below, 2 = left, 3 = above and 4 = right.
at	The points at which tick-marks are to be drawn.
include.symbol	Whether to include a dollar or percent symbol, where the symbol chosen depends on the function.
simplify	For dollars, simplify the amount to use abbreviations of "k", "m", "b", or "t" when numbers tend to be in the thousands, millions, billions, or trillions, respectively.
...	Arguments passed to <a href="#">axis</a>

**Value**

The numeric locations on the axis scale at which tick marks were drawn when the plot was first drawn.

**Author(s)**

David Diez

AxisInDollars(1, pretty(x))
```

---

AxisInPercent

*Build Better Looking Axis Labels for Percentages*

---

**Description**

Convert and simplify axis labels that are in percentages.

**Usage**

```
AxisInPercent(side, at, include.symbol = TRUE, simplify = TRUE, ...)
```

**Arguments**

side	An integer specifying which side of the plot the axis is to be drawn on. The axis is placed as follows: 1 = below, 2 = left, 3 = above and 4 = right.
at	The points at which tick-marks are to be drawn.
include.symbol	Whether to include a dollar or percent symbol, where the symbol chosen depends on the function.
simplify	For dollars, simplify the amount to use abbreviations of "k", "m", "b", or "t" when numbers tend to be in the thousands, millions, billions, or trillions, respectively.
...	Arguments passed to <a href="#">axis</a>

**Value**

The numeric locations on the axis scale at which tick marks were drawn when the plot was first drawn.

AxisInDollars(1, pretty(x))
```

---

babies

---

*The Child Health and Development Studies*

---

**Description**

The Child Health and Development Studies investigate a range of topics. One study, in particular, considered all pregnancies between 1960 and 1967 among women in the Kaiser Foundation Health Plan in the San Francisco East Bay area. The goal is to model the weight of the infants (bwt, in ounces) using variables including length of pregnancy in days (gestation), mother's age in years (age), mother's height in inches (height), whether the child was the first born (parity), mother's pregnancy weight in pounds (weight), and whether the mother was a smoker (smoke).

**Usage**

```
babies
```

**Format**

A data frame with 1236 rows and 8 variables:

**case** id number  
**bwt** birthweight, in ounces  
**gestation** length of gestation, in days  
**parity** binary indicator for a first pregnancy (0=first pregnancy)  
**age** mother's age in years  
**height** mother's height in inches  
**weight** mother's weight in pounds  
**smoke** binary indicator for whether the mother smokes

**Source**

These data come from Child Health and Development Studies. Also see the Gestation dataset from the mosaicData package.

---

babies\_crawl

*Crawling age*

---

**Description**

Crawling age of babies along with the average outdoor temperature at 6 months of age.

**Usage**

```
babies_crawl
```

**Format**

A data frame with 12 observations on the following 5 variables.

**birth\_month** A factor with levels corresponding to months  
**avg\_crawling\_age** a numeric vector  
**sd** a numeric vector  
**n** a numeric vector  
**temperature** a numeric vector

**Source**

J.B. Benson. Season of birth and onset of locomotion: Theoretical and methodological implications. In: Infant behavior and development 16.1 (1993), pp. 69-81. issn: 0163-6383.

## Examples

```
library(ggplot2)

ggplot(babies_crawl, aes(x = temperature, y = avg_crawling_age)) +
  geom_point() +
  labs(x = "Temperature", y = "Average crawling age")
```

---

bac

*Beer and blood alcohol content*

---

## Description

Here we examine data from sixteen student volunteers at Ohio State University who each drank a randomly assigned number of cans of beer.

## Usage

bac

## Format

A data frame with 16 observations on the following 3 variables.

**student** a numeric vector

**beers** a numeric vector

**bac** a numeric vector

## Source

J. Malkevitch and L.M. Lesser. For All Practical Purposes: Mathematical Literacy in Today's World. WH Freeman & Co, 2008.

## Examples

```
library(ggplot2)

ggplot(bac, aes(x = beers, y = bac)) +
  geom_point() +
  labs(x = "Number of beers", y = "Blood alcohol content")
```

---

ball_bearing	<i>Lifespan of ball bearings</i>
--------------	----------------------------------

---

**Description**

A simulated data set on lifespan of ball bearings.

**Usage**

```
ball_bearing
```

**Format**

A data frame with 75 observations on the following variable.

**life\_span** Lifespan of ball bearings (in hours).

**Source**

Simulated data.

**Examples**

```
library(ggplot2)

ggplot(ball_bearing, aes(x = life_span)) +
  geom_histogram(binwidth = 1)

qqnorm(ball_bearing$life_span)
```

---

bdims	<i>Body measurements of 507 physically active individuals.</i>
-------	--

---

**Description**

Body girth measurements and skeletal diameter measurements, as well as age, weight, height and gender, are given for 507 physically active individuals - 247 men and 260 women. These data can be used to provide statistics students practice in the art of data analysis. Such analyses range from simple descriptive displays to more complicated multivariate analyses such as multiple regression and discriminant analysis.

**Usage**

```
bdims
```

**Format**

A data frame with 507 observations on the following 25 variables.

**bia\_di** A numerical vector, respondent's biacromial diameter in centimeters.

**bii\_di** A numerical vector, respondent's biiliac diameter (pelvic breadth) in centimeters.

**bit\_di** A numerical vector, respondent's bitrochanteric diameter in centimeters.

**che\_de** A numerical vector, respondent's chest depth in centimeters, measured between spine and sternum at nipple level, mid-expiration.

**che\_di** A numerical vector, respondent's chest diameter in centimeters, measured at nipple level, mid-expiration.

**elb\_di** A numerical vector, respondent's elbow diameter in centimeters, measured as sum of two elbows.

**wri\_di** A numerical vector, respondent's wrist diameter in centimeters, measured as sum of two wrists.

**kne\_di** A numerical vector, respondent's knee diameter in centimeters, measured as sum of two knees.

**ank\_di** A numerical vector, respondent's ankle diameter in centimeters, measured as sum of two ankles.

**sho\_gi** A numerical vector, respondent's shoulder girth in centimeters, measured over deltoid muscles.

**che\_gi** A numerical vector, respondent's chest girth in centimeters, measured at nipple line in males and just above breast tissue in females, mid-expiration.

**wai\_gi** A numerical vector, respondent's waist girth in centimeters, measured at the narrowest part of torso below the rib cage as average of contracted and relaxed position.

**nav\_gi** A numerical vector, respondent's navel (abdominal) girth in centimeters, measured at umbilicus and iliac crest using iliac crest as a landmark.

**hip\_gi** A numerical vector, respondent's hip girth in centimeters, measured at level of bitrochanteric diameter.

**thi\_gi** A numerical vector, respondent's thigh girth in centimeters, measured below gluteal fold as the average of right and left girths.

**bic\_gi** A numerical vector, respondent's bicep girth in centimeters, measured when flexed as the average of right and left girths.

**for\_gi** A numerical vector, respondent's forearm girth in centimeters, measured when extended, palm up as the average of right and left girths.

**kne\_gi** A numerical vector, respondent's knee diameter in centimeters, measured as sum of two knees.

**cal\_gi** A numerical vector, respondent's calf maximum girth in centimeters, measured as average of right and left girths.

**ank\_gi** A numerical vector, respondent's ankle minimum girth in centimeters, measured as average of right and left girths.

**wri\_gi** A numerical vector, respondent's wrist minimum girth in centimeters, measured as average of right and left girths.

- age** A numerical vector, respondent's age in years.
- wgt** A numerical vector, respondent's weight in kilograms.
- hgt** A numerical vector, respondent's height in centimeters.
- sex** A categorical vector, 1 if the respondent is male, 0 if female.

### Examples

```
library(ggplot2)
ggplot(bdims, aes(x = hgt)) +
  geom_histogram(binwidth = 5)
ggplot(bdims, aes(x = hgt, y = wgt)) +
  geom_point() +
  labs(x = "Height", y = "Weight")

ggplot(bdims, aes(x = hgt, y = sho_gi)) +
  geom_point() +
  labs(x = "Height", y = "Shoulder girth")

ggplot(bdims, aes(x = hgt, y = hip_gi)) +
  geom_point() +
  labs(x = "Height", y = "Hip girth")
```

---

BG

*Add background color to a plot*

---

### Description

Overlays a colored rectangle over the entire plotting region.

### Usage

```
BG(col = openintro::COL[5, 9])
```

### Arguments

**col** Color to overlay.

### See Also

[COL](#)

**Examples**

```

Test <- function(col) {
  plot(1:7, col = COL[1:7], pch = 19, cex = 5,
       xlim = c(0, 8),
       ylim = c(0, 9))
  BG(col)
  points(2:8, col = COL[1:7], pch = 19, cex = 5)
  text(2, 6, "Correct Color")
  text(6, 2, "Affected Color")
}

par(mfrow = c(2, 2))

# Works well since black color almost fully transparent
Test(COL[5, 9])

# Works less well since transparency isn't as significant
Test(COL[5, 6])

# Pretty ugly due to overlay
Test(COL[5, 3])

# Basically useless due to heavy color gradient
Test(COL[4, 2])

```

---

birds

*Aircraft-Wildlife Collisions*

---

**Description**

A collection of all collisions between aircraft in wildlife that were reported to the US Federal Aviation Administration between 1990 and 1997, with details on the circumstances of the collision.

**Usage**

```
birds
```

**Format**

A data frame with 19302 observations on the following 17 variables.

**opid** Three letter identification code for the operator (carrier) of the aircraft.

**operator** Name of the aircraft operator.

**atype** Make and model of aircraft.

**remarks** Verbal remarks regarding the collision.

**phase\_of\_flight** Phase of the flight during which the collision occurred: Approach, Climb, Descent, En Route, Landing Roll, Parked, Take-off run, Taxi.

**ac\_mass** Mass of the aircraft classified as 2250 kg or less (1), 2251-5700 kg (2), 5701-27000 kg (3), 27001-272000 kg (4), above 272000 kg (5).

**num\_engs** Number of engines on the aircraft.

**date** Date of the collision (MM/DD/YYYY).

**time\_of\_day** Light conditions: Dawn, Day, Dusk, Night.

**state** Two letter abbreviation of the US state in which the collision occurred.

**height** Feet above ground level.

**speed** Knots (indicated air speed).

**effect** Effect on flight: Aborted Take-off, Engine Shut Down, None, Other, Precautionary Landing.

**sky** Type of cloud cover, if any: No Cloud, Overcast, Some Cloud.

**species** Common name for bird or other wildlife.

**birds\_seen** Number of birds/wildlife seen by pilot: 1, 2-10, 11-100, Over 100.

**birds\_struck** Number of birds/wildlife struck: 0, 1, 2-10, 11-100, Over 100.

### Details

The FAA National Wildlife Strike Database contains strike reports that are voluntarily reported to the FAA by pilots, airlines, airports and others. Current research indicates that only about 20% of strikes are reported. Wildlife strike reporting is not uniform as some organizations have more robust voluntary reporting procedures. Because of variations in reporting, users are cautioned that the comparisons between individual airports or airlines may be misleading.

### Source

Aircraft Wildlife Strike Data: Search Tool - FAA Wildlife Strike Database. Available at <https://dev.socrata.com/foundry/datahub.transportation.gov/jhay-dgxy>. Retrieval date: Feb 4, 2012.

### Examples

```
library(dplyr)
library(ggplot2)
library(forcats)
library(tidyr)

# Phase of the flight during which the collision occurred, tabular
birds %>%
  count(phase_of_flight, sort = TRUE)

# Phase of the flight during which the collision occurred, barplot
ggplot(birds, aes(y = fct_infreq(phase_of_flight))) +
  geom_bar() +
  labs(x = "Phase of flight")
```

```
# Height summary statistics
summary(birds$height)

# Phase of flight vs. effect of crash
birds %>%
  drop_na(phase_of_flt, effect) %>%
  ggplot(aes(y = phase_of_flt, fill = effect)) +
  geom_bar(position = "fill") +
  labs(x = "Proportion", y = "Phase of flight", fill = "Effect")
```

---

 births

*North Carolina births*

---

### Description

Data on a random sample of 100 births for babies in North Carolina where the mother was not a smoker and another 50 where the mother was a smoker.

### Usage

```
births
```

### Format

A data frame with 150 observations on the following 14 variables.

**f\_age** Father's age.

**m\_age** Mother's age.

**weeks** Weeks at which the mother gave birth.

**premature** Indicates whether the baby was premature or not.

**visits** Number of hospital visits.

**gained** Weight gained by mother.

**weight** Birth weight of the baby.

**sex\_baby** Gender of the baby.

**smoke** Whether or not the mother was a smoker.

### Source

Birth records released by North Carolina in 2004.

### Examples

```
library(ggplot2)

ggplot(births, aes(x = smoke, y = weight)) +
  geom_boxplot()
```

---

books	<i>Sample of books on a shelf</i>
-------	-----------------------------------

---

**Description**

Simulated data set.

**Usage**

```
books
```

**Format**

A data frame with 95 observations on the following 2 variables.

**type** a factor with levels fiction and nonfiction

**format** a factor with levels hardcover and paperback

**Examples**

```
table(books)
```

---

boxPlot	<i>Box plot</i>
---------	-----------------

---

**Description**

An alternative to `boxplot`. Equations are not accepted. Instead, the second argument, `fact`, is used to split the data.

**Usage**

```
boxPlot(  
  x,  
  fact = NULL,  
  horiz = FALSE,  
  width = 2/3,  
  lwd = 1,  
  lcol = "black",  
  medianLwd = 2,  
  pch = 20,  
  pchCex = 1.8,  
  col = grDevices::rgb(0, 0, 0, 0.25),  
  add = FALSE,
```

```

    key = NULL,
    axes = TRUE,
    xlab = "",
    ylab = "",
    xlim = NULL,
    ylim = NULL,
    na.rm = TRUE,
    ...
)

```

### Arguments

x	A numerical vector.
fact	A character or factor vector defining the grouping for side-by-side box plots.
horiz	If TRUE, the box plot is oriented horizontally.
width	The width of the boxes in the plot. Value between 0 and 1.
lwd	Width of lines used in box and whiskers.
lcol	Color of the box, median, and whiskers.
medianLwd	Width of the line marking the median.
pch	Plotting character of outliers.
pchCex	Size of outlier character.
col	Color of outliers.
add	If FALSE, a new plot is created. Otherwise, the boxplots are added to the current plot for values of TRUE or a numerical vector specifying the locations of the boxes.
key	The order in which to display the side-by-side boxplots. If locations are specified in add, then the elements of add will correspond to the elements of key.
axes	Whether to plot the axes.
xlab	Label for the x axis.
ylab	Label for the y axis.
xlim	Limits for the x axis.
ylim	Limits for the y axis.
na.rm	Indicate whether NA values should be removed.
...	Additional arguments to plot.

---

Braces

*Plot a Braces Symbol*

---

### Description

This function is not yet very flexible.

### Usage

```
Braces(x, y, face.radians = 0, long = 1, short = 0.2, ...)
```

### Arguments

x	x-coordinate of the center of the braces.
y	y-coordinate of the center of the braces.
face.radians	Radians of where the braces should face. For example, the default with <code>face.radians = 0</code> has the braces facing right. Setting to $\pi / 2$ would result in the braces facing up.
long	The units for the long dimension of the braces.
short	The units for the short dimension of the braces. This must be less than or equal to half of the long dimension.
...	Arguments passed to <a href="#">lines</a> .

### Author(s)

David Diez

### See Also

[dlsegments](#)

### Examples

```
plot(0:1, 0:1, type = "n")
Braces(0.5, 0.5, face.radians = 3 * pi / 2)
```

---

buildAxis	<i>Axis function substitute</i>
-----------	---------------------------------

---

### Description

The function `buildAxis` is built to provide more control of the number of labels on the axis. This function is still under development.

### Usage

```
buildAxis(side, limits, n, nMin = 2, nMax = 10, extend = 2, eps = 10^-12, ...)
```

### Arguments

<code>side</code>	The side of the plot where to add the axis.
<code>limits</code>	Either lower and upper limits on the axis or a data set.
<code>n</code>	The preferred number of axis labels.
<code>nMin</code>	The minimum number of axis labels.
<code>nMax</code>	The maximum number of axis labels.
<code>extend</code>	How far the axis may extend beyond <code>range(limits)</code> .
<code>eps</code>	The smallest increment allowed.
<code>...</code>	Arguments passed to <code>axis</code>

### Details

The primary reason behind building this function was to allow a plot to be created with similar features but with different data sets. For instance, if a set of code was written for one data set and the function `axis` had been utilized with pre-specified values, the axis may not match the plot of a new set of data. The function `buildAxis` addresses this problem by allowing the number of axis labels to be specified and controlled.

The axis is built by assigning penalties to a variety of potential axis setups, ranking them based on these penalties and then selecting the axis with the best score.

### Value

A vector of the axis plotted.

calc_streak	<i>Calculate hit streaks</i>
-------------	------------------------------

---

**Description**

Calculate hit streaks

**Usage**

```
calc_streak(x)
```

**Arguments**

x A character vector of hits ("H") and misses ("M").

**Value**

A data frame with one column, 'length', containing the length of each hit streak.

**Examples**

```
data(kobe_basket)
calc_streak(kobe_basket$shot)
```

---

cancer_in_dogs	<i>Cancer in dogs</i>
----------------	-----------------------

---

**Description**

A study in 1994 examined 491 dogs that had developed cancer and 945 dogs as a control group to determine whether there is an increased risk of cancer in dogs that are exposed to the herbicide 2,4-Dichlorophenoxyacetic acid (2,4-D).

**Usage**

```
cancer_in_dogs
```

**Format**

A data frame with 1436 observations on the following 2 variables.

**order** a factor with levels 2, 4-D and no 2, 4-D

**response** a factor with levels cancer and no cancer

**Source**

Hayes HM, Tarone RE, Cantor KP, Jessen CR, McCurnin DM, and Richardson RC. 1991. Case-Control Study of Canine Malignant Lymphoma: Positive Association With Dog Owner's Use of 2, 4- Dichlorophenoxyacetic Acid Herbicides. *Journal of the National Cancer Institute* 83(17):1226-1231.

cards	<i>Deck of cards</i>
-------	----------------------

---

**Description**

All the cards in a standard deck.

**Usage**

```
cards
```

**Format**

A data frame with 52 observations on the following 4 variables.

**value** a factor with levels 10 2 3 4 5 6 7 8 9 A J K Q

**color** a factor with levels black red

**suit** a factor with levels Club Diamond Heart Spade

**face** a logical vector

**Examples**

```
table(cards$value)
table(cards$color)
table(cards$suit)
table(cards$face)
table(cards$suit, cards$face)
```

---

`cars93``cars93`

---

### Description

A data frame with 54 rows and 6 columns. This data is a subset of the Cars93 data set from the MASS package.

### Usage

```
cars93
```

### Format

A data frame with 54 observations on the following 6 variables.

**type** The vehicle type with levels large, midsize, and small.

**price** Vehicle price (USD).

**mpg\_city** Vehicle mileage in city (miles per gallon).

**drive\_train** Vehicle drive train with levels 4WD, front, and rear.

**passengers** The vehicle passenger capacity.

**weight** Vehicle weight (lbs).

### Details

These cars represent a random sample for 1993 models that were in both *Consumer Reports* and *PACE Buying Guide*. Only vehicles of type small, midsize, and large were include.

Further description can be found in Lock (1993). Use the URL <http://www.amstat.org/publications/jse/v1n1/datasets.lock.html>.

### Source

Lock, R. H. (1993) 1993 New Car Data. *Journal of Statistics Education* 1(1).

### Examples

```
library(ggplot2)

# Vehicle price by type
ggplot(cars93, aes(x = price)) +
  geom_histogram(binwidth = 5) +
  facet_wrap(~type)

# Vehicle price vs. weight
ggplot(cars93, aes(x = weight, y = price)) +
  geom_point()
```

```
# Mileage vs. weight
ggplot(cars93, aes(x = weight, y = mpg_city)) +
  geom_point() +
  geom_smooth()
```

---

cchousing

*Community college housing (simulated data)*

---

### Description

These are simulated data and intended to represent housing prices of students at a community college.

### Usage

```
cchousing
```

### Format

A data frame with 75 observations on the following variable.

**price** Monthly housing price, simulated.

### Examples

```
hist(cchousing$price)
```

---

CCP

*Plot a Cartesian Coordinate Plane*

---

### Description

Create a Cartesian Coordinate Plane.

**Usage**

```
CCP(
  xlim = c(-4, 4),
  ylim = c(-4, 4),
  mar = rep(0, 4),
  length = 0.1,
  tcl = 0.007,
  xylab = FALSE,
  ticks = 1,
  ticklabs = 1,
  xpos = 1,
  ypos = 2,
  cex.coord = 1,
  cex.xylab = 1.5,
  add = FALSE
)
```

**Arguments**

xlim	The x-limits for the plane (vector of length 2).
ylim	The y-limits for the plane (vector of length 2).
mar	Plotting margins.
length	The length argument is passed to the <a href="#">arrows</a> function and is used to control the size of the arrow.
tcl	Tick size.
xylab	Whether x and y should be shown next to the labels.
ticks	How frequently tick marks should be shown on the axes. If a vector of length 2, the first argument will correspond to the x-axis and the second to the y-axis.
ticklabs	How frequently tick labels should be shown on the axes. If a vector of length 2, the first argument will correspond to the x-axis and the second to the y-axis.
xpos	The position of the labels on the x-axis. See the pos argument in the <a href="#">text</a> function for additional details.
ypos	The position of the labels on the y-axis. See the pos argument in the <a href="#">text</a> function for additional details.
cex.coord	Inflation factor for font size of the coordinates, where any value larger than zero is acceptable and 1 corresponds to the default.
cex.xylab	Inflation factor for font size of the x and y labels, where any value larger than zero is acceptable and 1 corresponds to the default.
add	Indicate whether a new plot should be created (FALSE, the default) or if the Cartesian Coordinate Plane should be added to the existing plot.

CCP()
```

```
CCP(xylab=TRUE, ylim=c(-3.5, 2), xpos=3, cex.coord=1)
```

```
CCP(xlim=c(-8, 8), ylim=c(-10, 6), ticklabs=c(2,2), cex.xylab=0.8)
```

---

census

*Random sample of 2000 U.S. Census Data*

---

**Description**

A random sample of 500 observations from the 2000 U.S. Census Data.

**Usage**

```
census
```

**Format**

A data frame with 500 observations on the following 8 variables.

**census\_year** Census Year.

**state\_fips\_code** Name of state.

**total\_family\_income** Total family income (in U.S. dollars).

**age** Age.

**sex** Sex with levels Female and Male.

**race\_general** Race with levels American Indian or Alaska Native, Black, Chinese, Japanese, Other Asian or Pacific Islander, Two major races, White and Other.

**marital\_status** Marital status with levels Divorced, Married/spouse absent, Married/spouse present, Never married/single, Separated and Widowed.

**total\_personal\_income** Total personal income (in U.S. dollars).

**Source**

<http://factfinder.census.gov>

## Examples

```
library(dplyr)
library(ggplot2)

census %>%
  filter(total_family_income > 0) %>%
  ggplot(aes(x = total_family_income)) +
  geom_histogram(binwidth = 25000)
```

---

cherry

*Summary information for 31 cherry trees*

---

## Description

Researchers wanting to understand the relationship between these variables for black cherry trees collected data from 31 trees in the Allegheny National Forest, Pennsylvania.

## Usage

```
cherry
```

## Format

A data frame with 31 observations on the following 3 variables.

**diam** diameter in inches (at 54 inches above ground)

**height** height is measured in feet

**volume** volume in cubic feet

## Source

D.J. Hand. A handbook of small data sets. Chapman & Hall/CRC, 1994.

## Examples

```
library(ggplot2)
library(broom)

ggplot(cherry, aes(x = diam, y = volume)) +
  geom_point() +
  geom_smooth(method = "lm")

mod <- lm(volume ~ diam + height, cherry)
tidy(mod)
```

---

children\_gender\_stereo

*Gender Stereotypes in 5-7 year old Children*

---

## Description

Stereotypes are common, but at what age do they start? This study investigates stereotypes in young children aged 5-7 years old. There are four studies reported in the [paper](#), and all four data sets are provided here.

## Usage

children\_gender\_stereo

## Format

This data object is more unusual than most. It is a list of 4 data frames. The four data frames correspond to the data used in Studies 1-4 of the referenced [paper](#), and these data frames each have variables (columns) that are among the following:

**subject** Subject ID. Note that Subject 1 in the first data frame (data set) does **not** correspond to Subject 1 in the second data frame.

**gender** Gender of the subject.

**age** Age of the subject, in years.

**trait** The trait that the children were making a judgement about, which was either nice or smart.

**target** The age group of the people the children were making judgements about (as being either nice or smart): children or adults.

**stereotype** The proportion of trials where the child picked a gender target that matched the trait that was the same as the gender of the child. For example, suppose we had 18 pictures, where each picture showed 2 men and 2 women (and a different set of people in each photo). Then if we asked a boy to pick the person in each picture who they believed to be really smart, this stereotype variable would report the fraction of pictures where the boy picked a man. When a girl reviews the photos, then this stereotype variable reports the fraction of photos where she picked a woman. That is, this variable differs in meaning depending on the gender of the child. (This variable design is a little confusing, but it is useful when analyzing the data.)

**high\_achieve\_caution** The proportion of trials where the child said that children of their own gender were high-achieving in school.

**interest** Average score that measured the interest of the child in the game.

**difference** A difference score between the interest of the child in the “smart” game and their interest in the “try-hard” game.

## Details

The structure of the data object is a little unusual, so we recommend reviewing the Examples section before starting your analysis.

Thank you to Nicholas Horton for pointing us to this study and the data!

Most of the results in the paper can be reproduced using the data provided here.

## Source

Bian L, Leslie SJ, Cimpian A. 2017. "Gender stereotypes about intellectual ability emerge early and influence children's interests". *Science* 355:6323 (389-391). <https://science.sciencemag.org/content/355/6323/389>.

The original data may be found [here](#).

## Examples

```
# This data set is a little funny to work with.  
# If wanting to review the data for a study, we  
# recommend first assigning the corresponding  
# data frame to a new variable with a shorter  
# name. For instance, below we assign the second  
# study's data to an object called `d`  
# (d is for data!).  
d <- children_gender_stereo[[2]]
```

---

china

*Child care hours*

---

## Description

The China Health and Nutrition Survey aims to examine the effects of the health, nutrition, and family planning policies and programs implemented by national and local governments.

## Usage

china

## Format

A data frame with 9788 observations on the following 3 variables.

**gender** a numeric vector

**edu** a numeric vector

**child\_care** a numeric vector

**Source**

UNC Carolina Population Center, China Health and Nutrition Survey, 2006.

**Examples**

```
summary(china)
```

---

ChiSquareTail	<i>Plot upper tail in chi-square distribution</i>
---------------	---

---

**Description**

Plot a chi-square distribution and shade the upper tail.

**Usage**

```
ChiSquareTail(  
  U,  
  df,  
  xlim = c(0, 10),  
  col = fadeColor("black", "22"),  
  axes = TRUE,  
  ...  
)
```

**Arguments**

U	Cut off for the upper tail.
df	Degrees of freedom.
xlim	Limits for the plot.
col	Color of the shading.
axes	Whether to plot an x-axis.
...	Currently ignored.

**Value**

Nothing is returned from the function.

**Author(s)**

David Diez

**See Also**

              col = COL[1])
```

---

cia\_factbook

*CIA Factbook Details on Countries*

---

## Description

Country-level statistics from the US Central Intelligence Agency (CIA).

## Usage

```
cia_factbook
```

## Format

A data frame with 259 observations on the following 11 variables.

**country** Country name.

**area** Land area, in square kilometers. (1 square kilometer is 0.386 square miles)

**birth\_rate** Birth rate, in births per 1,000 people.

**death\_rate** Death rate, in deaths per 1,000 people.

**infant\_mortality\_rate** Infant mortality, in deaths per 1,000 live births.

**internet\_users** Total number of internet users.

**life\_exp\_at\_birth** Live expectancy at birth, in years.

**maternal\_mortality\_rate** Number of female deaths per 100,000 live births where the death is related to pregnancy or birth.

**net\_migration\_rate** Net migration rate.

**population** Total population.

**population\_growth\_rate** Population growth rate.

## Source

CIA Factbook, Country Comparisons, 2014. <https://www.cia.gov/library/publications/the-world-factbook/rankorder/rankorderguide.html>

## Examples

```
library(dplyr)
library(ggplot2)

cia_factbook_iup <- cia_factbook %>%
  mutate(internet_users_percent = 100 * internet_users / population)

ggplot(cia_factbook_iup, aes(x = internet_users_percent, y = life_exp_at_birth)) +
  geom_point() +
  labs(x = "Percentage of internet users", y = "Life expectancy at birth")
```

---

classdata

*Simulated class data*

---

## Description

This data is simulated and is meant to represent students scores from three different lectures who were all given the same exam.

## Usage

```
classdata
```

## Format

A data frame with 164 observations on the following 2 variables.

**m1** Represents a first midterm score.

**lecture** Three classes: a, b, and c.

## References

OpenIntro Statistics, Chapter 8.

## Examples

```
anova(lm(m1 ~ lecture, classdata))
```

---

`cle_sac`*Cleveland and Sacramento*

---

**Description**

Data on a sample of 500 people from the Cleveland, OH and Sacramento, CA metro areas.

**Usage**`cle_sac`**Format**

A data frame with 500 observations representing people on the following 8 variables.

**year** Year the data was collected.

**state** State where person resides.

**city** City.

**age** Age of the person.

**sex** Gender.

**race** Ethnicity.

**marital\_status** Marital status.

**personal\_income** Personal income.

**Examples**

```
library(ggplot2)

ggplot(cle_sac, aes(x = personal_income)) +
  geom_histogram(binwidth = 20000) +
  facet_wrap(~city)
```

---

`climate70`*Temperature Summary Data, Geography Limited*

---

**Description**

A random set of monitoring locations were taken from NOAA data that had both years of interest (1948 and 2018) as well as data for both summary metrics of interest (dx70 and dx90, which are described below).

**Usage**`climate70`**Format**

A data frame with 197 observations on the following 7 variables.

**station** Station ID.

**latitude** Latitude of the station.

**longitude** Longitude of the station.

**dx70\_1948** Number of days above 70 degrees in 1948.

**dx70\_2018** Number of days above 70 degrees in 2018.

**dx90\_1948** Number of days above 90 degrees in 1948.

**dx90\_2018** Number of days above 90 degrees in 2018.

**Details**

Please keep in mind that these are two annual snapshots, and a complete analysis would consider much more than two years of data and much additional information for those years.

**Source**

<https://www.ncdc.noaa.gov/cdo-web/datasets>, retrieved 2019-04-24.

**Examples**

```
# Data sampled are from the US, Europe, and Australia.
# This geographic limitation may be due to the particular
# years considered, since locations without both 1948 and
# 2018 were discarded for this (simple) data set.
plot(climate70$longitude, climate70$latitude)

par(mfrow = c(2, 2))
plot(climate70$dx70_1948, climate70$dx70_2018)
abline(0, 1, lty = 2)
plot(climate70$dx90_1948, climate70$dx90_2018)
abline(0, 1, lty = 2)
hist(climate70$dx70_2018 - climate70$dx70_1948)
hist(climate70$dx90_2018 - climate70$dx90_1948)

t.test(climate70$dx70_2018 - climate70$dx70_1948)
t.test(climate70$dx90_2018 - climate70$dx90_1948)
```

---

coast_starlight	<i>Coast Starlight Amtrak train</i>
-----------------	-------------------------------------

---

**Description**

Travel times and distances.

**Usage**

```
coast_starlight
```

**Format**

A data frame with 16 observations on the following 3 variables.

**station** Station.

**dist** Distance.

**travel\_time** Travel time.

**Examples**

```
library(ggplot2)

ggplot(coast_starlight, aes(x = dist, y = travel_time)) +
  geom_point()
```

---

COL	<i>OpenIntro Statistics colors</i>
-----	------------------------------------

---

**Description**

These are the core colors used for the OpenIntro Statistics textbook. The blue, green, yellow, and red colors are also gray-scaled, meaning no changes are required when printing black and white copies.

**Usage**

```
COL
```

**Format**

A 7-by-4 matrix of 7 colors with four fading scales: blue, green, yellow, red, black, gray, and light gray.

**Source**

Colors selected by OpenIntro's in-house graphic designer, [Meenal Patel](#).

**Examples**

```
plot(1:7, 7:1, col=COL, pch=19, cex=6, xlab="", ylab="",
     xlim=c(0.5,7.5), ylim=c(-2.5,8), axes=FALSE)
text(1:7, 7:1+0.7, paste("COL[", 1:7, "]", sep=""), cex=0.9)
points(1:7, 7:1-0.7, col=COL[,2], pch=19, cex=6)
points(1:7, 7:1-1.4, col=COL[,3], pch=19, cex=6)
points(1:7, 7:1-2.1, col=COL[,4], pch=19, cex=6)
```

---

contTable

*Generate Contingency Tables for LaTeX*

---

**Description**

Input a data frame or a table, and the LaTeX output will be returned. Options exist for row and column proportions as well as for showing work.

**Usage**

```
contTable(x, prop = c("none", "row", "col"), show = FALSE, digits = 3)
```

**Arguments**

x	A data frame (with two columns) or a table.
prop	Indicate whether row ("r", "R", "row") or column ("c", "C", "col") proportions should be used. The default is to simply print the contingency table.
show	If row or column proportions are specified, indicate whether work should be shown.
digits	The number of digits after the decimal that should be shown for row or column proportions.

**Details**

The contTable function makes substantial use of the [cat](#) function.

**Author(s)**

David Diez

table(email[,c("spam", "sent_email")])
contTable(email[,c("spam", "sent_email")])
```

---

corr\_match

*Sample data sets for correlation problems*

---

**Description**

Simulated data.

**Usage**

```
corr_match
```

**Format**

A data frame with 121 observations on the following 9 variables.

**x** a numeric vector

**y1** a numeric vector

**y2** a numeric vector

**y3** a numeric vector

**y4** a numeric vector

**y5** a numeric vector

**y6** a numeric vector

**y7** a numeric vector

**y8** a numeric vector

**Source**

Simulated data set.

**Examples**

```
library(ggplot2)

ggplot(corr_match, aes(x = x, y = y1)) +
  geom_point()

cor(corr_match$x, corr_match$y1)
```

---

country_iso	<i>Country ISO information</i>
-------------	--------------------------------

---

**Description**

Country International Organization for Standardization (ISO) information.

**Usage**

country\_iso

**Format**

A data frame with 249 observations on the following 4 variables.

**country\_code** Two-letter ISO country code.

**country\_name** Country name.

**year** Year the two-letter ISO country code was assigned.

**top\_level\_domain** op-level domain name.

**Source**

Wikipedia, retrieved 2018-11-18. [https://en.wikipedia.org/wiki/ISO\\_3166-1\\_alpha-2](https://en.wikipedia.org/wiki/ISO_3166-1_alpha-2)

**Examples**

country\_iso

---

cpr	<i>CPR data set</i>
-----	---------------------

---

**Description**

These patients were randomly divided into a treatment group where they received a blood thinner or the control group where they did not receive a blood thinner. The outcome variable of interest was whether the patients survived for at least 24 hours.

**Usage**

cpr

**Format**

A data frame with 90 observations on the following 2 variables.

**group** a factor with levels control and treatment

**outcome** a factor with levels died and survived

**Source**

Efficacy and safety of thrombolytic therapy after initially unsuccessful cardiopulmonary resuscitation: a prospective clinical trial, by Bottiger et al., The Lancet, 2001.

**Examples**

```
table(cpr)
```

---

credits	<i>College credits.</i>
---------	-------------------------

---

**Description**

A simulated data set of number of credits taken by college students each semester.

**Usage**

```
credits
```

**Format**

A data frame with 100 observations on the following variable.

**credits** Number of credits.

**Source**

Simulated data.

**Examples**

```
library(ggplot2)

ggplot(credits, aes(x = credits)) +
  geom_histogram(binwidth = 1)
```

---

CT2DF

*Contingency Table to Data Frame*

---

### Description

Take a 2D contingency table and create a data frame representing the individual cases.

### Usage

```
CT2DF(x, rn = row.names(x), cn = colnames(x), dfn = c("row.var", "col.var"))
```

### Arguments

x	Contingency table as a matrix.
rn	Character vector of the row names.
cn	Character vector of the column names.
dfn	Character vector with 2 values for the variable representing the rows and columns.

### Value

A data frame with two columns.

### Author(s)

David Diez

### See Also

[MosaicPlot](#)

### Examples

```
a <- matrix(
  c(459, 727, 854, 385, 99, 4198, 6245, 4821, 1634, 578),
  2,
  byrow = TRUE)
b <-
CT2DF(
  a,
  c("No", "Yes"),
  c("Excellent", "Very good", "Good", "Fair", "Poor"),
  c("coverage", "health_status"))
table(b)
```

densityPlot

*Density plot***Description**

Compute kernel density plots, written in the same structure as `boxPlot`. Histograms can be automatically added for teaching purposes.

**Usage**

```
densityPlot(
  x,
  fact = NULL,
  bw = "nrd0",
  histo = c("none", "faded", "hollow"),
  breaks = "Sturges",
  fading = "0E",
  fadingBorder = "25",
  lty = NULL,
  lwd = 1,
  col = c("black", "red", "blue"),
  key = NULL,
  add = FALSE,
  adjust = 1,
  kernel = c("gaussian", "epanechnikov", "rectangular", "triangular", "biweight",
    "cosine", "optcosine"),
  weights = NULL,
  n = 512,
  from,
  to,
  na.rm = FALSE,
  xlim = NULL,
  ylim = NULL,
  main = "",
  ...
)
```

**Arguments**

<code>x</code>	A numerical vector.
<code>fact</code>	A character or factor vector defining the grouping for data in <code>x</code> .
<code>bw</code>	Bandwidth. See <code>density</code> .
<code>histo</code>	Whether to plot a faded histogram ('faded') or hollow histogram ('hollow') in the background. By default, no histogram will be plotted.
<code>breaks</code>	The breaks argument for <code>histPlot</code> if <code>histo</code> is 'faded' or 'hollow'.

fading	Character value of hexadecimal, e.g. '22' or '5D', describing the amount of fading inside the rectangles of the histogram if histo='faded'.
fadingBorder	Character value of hexadecimal, e.g. '22' or '5D', describing the amount of fading of the rectangle borders of the histogram if histo is 'faded' or 'hollow'.
lty	Numerical vector describing the line type for the density curve(s). Each element corresponds to a different level of the argumentfact.
lwd	Numerical vector describing the line width for the density curve(s). Each element corresponds to a different level of the argumentfact.
col	Numerical vector describing the line color for the density curve(s). Each element corresponds to a different level of the argumentfact.
key	An argument to specify ordering of the factor levels.
add	If TRUE, the density curve is added to the plot.
adjust	Argument passed to density to adjust the bandwidth.
kernel	Argument passed to density to select the kernel used.
weights	Argument passed to density to weight observations.
n	Argument passed to density to specify the detail in the density estimate.
from	Argument passed to density specifying the lowest value to include in the density estimate.
to	Argument passed to density specifying the largest value to include in the density estimate.
na.rm	Argument passed to density specifying handling of NA values.
xlim	x-axis limits.
ylim	y-axis limits.
main	Title for the plot.
...	If add=FALSE, then additional arguments to plot.

**Author(s)**

David Diez

```

---

diabetes2

*Type 2 Diabetes Clinical Trial for Patients 10-17 Years Old*

---

### Description

Three treatments were compared to test their relative efficacy (effectiveness) in treating Type 2 Diabetes in patients aged 10-17 who were being treated with metformin. The primary outcome was lack of glycemic control (or not); lacking glycemic control means the patient still needed insulin, which is not the preferred outcome for a patient.

### Usage

```
diabetes2
```

### Format

A data frame with 699 observations on the following 2 variables.

**treatment** The treatment the patient received.

**outcome** Whether there patient still needs insulin (failure) or met a basic positive outcome bar (success).

### Details

Each of the 699 patients in the experiment were randomized to one of the following treatments: (1) continued treatment with metformin (coded as met), (2) formin combined with rosiglitazone (coded as rosi), or or (3) a lifestyle-intervention program (coded as lifestyle).

### Source

Zeitler P, et al. 2012. A Clinical Trial to Maintain Glycemic Control in Youth with Type 2 Diabetes. N Engl J Med.

**Examples**

```
lapply(diabetes2, table)
(cont.table <- table(diabetes2))
(m <- chisq.test(cont.table))
m$expected
```

---

dlsegments

---

*Create a Double Line Segment Plot*

---

**Description**

Creae a plot showing two line segments. The union or intersection of those line segments can also be generated by utilizing the type argument.

**Usage**

```
dlsegments(
  x1 = c(3, 7),
  x2 = c(5, 9),
  l = c("o", "o"),
  r = c("c", "c"),
  type = c("n", "u", "i"),
  COL = 2,
  lwd = 2.224,
  ylim = c(-0.35, 2),
  mar = rep(0, 4),
  hideOrig = FALSE
)
```

**Arguments**

- |      |   |
|------|---|
| x1   | The endpoints of the first interval. Values larger (smaller) than 999 (-999) will be interpreted as (negative) infinity.  |
| x2   | The endpoints of the second interval. Values larger (smaller) than 999 (-999) will be interpreted as (negative) infinity.   |
| l    | A vector of length 2, where the values correspond to the left end point of each interval. A value of "o" indicates the interval is open at the left and "c" indicates the interval is closed at this end.   |
| r    | A vector of length 2, where the values correspond to the right end point of each interval. A value of "o" indicates the interval is open at the right and "c" indicates the interval is closed at this end. |
| type | By default, no intersection or union of the two lines will be shown (value of "n"). To show the union of the line segments, specify "u". To indicate that the intersection be shown, specify "i".           |

COL	If the union or intersection is to be shown (see the <code>type</code> argument), then this parameter controls the color that will be shown.
lwd	If the union or intersection is to be shown (see the <code>type</code> argument), then this parameter controls the width of any corresponding lines or open points in the union or intersection.
ylim	A vector of length 2 specifying the vertical plotting limits, which may be useful for fine-tuning plots. The default is <code>c(-0.35, 2)</code> .
mar	A vector of length 4 that represent the plotting margins.
hideOrig	An optional argument that to specify that the two line segments should be shown ( <code>hideOrig</code> takes value <code>FALSE</code> , the default) or that they should be hidden ( <code>hideOrig</code> takes value <code>TRUE</code> ).

```

---

dotPlot*Dot plot*

---

**Description**

Plot observations as dots.

**Usage**

```
dotPlot(
  x,
  fact = NULL,
  vertical = FALSE,
  at = 1,
```

```

key = NULL,
pch = 20,
col = fadeColor("black", "66"),
cex = 1.5,
add = FALSE,
axes = TRUE,
xlim = NULL,
ylim = NULL,
...
)

```

### Arguments

<code>x</code>	A numerical vector.
<code>fact</code>	A character or factor vector defining the grouping for data in <code>x</code> .
<code>vertical</code>	If TRUE, the plot will be oriented vertically.
<code>at</code>	The vertical coordinate of the points, or the horizontal coordinate if <code>vertical=TRUE</code> . If <code>fact</code> is provided, then locations can be specified for each group.
<code>key</code>	The factor levels corresponding to <code>at</code> , <code>pch</code> , <code>col</code> , and <code>cex</code> .
<code>pch</code>	Plotting character. If <code>fact</code> is given, then different plotting characters can be specified for each factor level. If <code>key</code> is specified, the elements of <code>pch</code> will correspond to the elements of <code>key</code> .
<code>col</code>	Plotting character color. If <code>fact</code> is given, then different colors can be specified for each factor level. If <code>key</code> is specified, the elements of <code>col</code> will correspond to the elements of <code>key</code> .
<code>cex</code>	Plotting character size. If <code>fact</code> is given, then different character sizes can be specified for each factor level. If <code>key</code> is specified, the elements of <code>cex</code> will correspond to the elements of <code>key</code> .
<code>add</code>	If TRUE, then the points are added to the plot.
<code>axes</code>	If FALSE, no axes are plotted.
<code>xlim</code>	Limits for the x axis.
<code>ylim</code>	Limits for the y axis.
<code>...</code>	Additional arguments to be passed to <code>plot</code> if <code>add=FALSE</code> or <code>points</code> if <code>add=TRUE</code> .

```

---

dotPlotStack

*Add a Stacked Dot Plot to an Existing Plot*

---

**Description**

Add a stacked dot plot to an existing plot. The locations for the points in the dot plot are returned from the function in a list.

**Usage**

```
dotPlotStack(x, radius = 1, seed = 1, addDots = TRUE, ...)
```

**Arguments**

**x** A vector of numerical observations for the dot plot.

radius	The approximate distance that should separate each point.
seed	A random seed (integer). Different values will produce different variations.
addDots	Indicate whether the points should be added to the plot.
...	Additional arguments are passed to <a href="#">points</a> .

**Value**

Returns a list with a height that can be used as the upper bound of ylim for a plot, then also the x- and y-coordinates of the points in the stacked dot plot.

ebola_survey	<i>Survey on Ebola quarantine</i>
--------------	-----------------------------------

---

**Description**

In New York City on October 23rd, 2014, a doctor who had recently been treating Ebola patients in Guinea went to the hospital with a slight fever and was subsequently diagnosed with Ebola. Soon thereafter, an NBC 4 New York/The Wall Street Journal/Marist Poll asked New Yorkers whether they favored a "mandatory 21-day quarantine for anyone who has come in contact with an Ebola patient". This poll included responses of 1,042 New York adults between October 26th and 28th, 2014.

**Usage**

ebola\_survey

**Format**

A data frame with 1042 observations on the following variable.

**quarantine** Indicates whether the respondent is in favor or against the mandatory quarantine.

**Source**

Poll ID NY141026 on maristpoll.marist.edu.

**Examples**

 email

*Data frame representing information about a collection of emails*

---

### Description

These data represent incoming emails for the first three months of 2012 for an email account (see Source).

### Usage

email

### Format

A email (email\_sent) data frame has 3921 (1252) observations on the following 21 variables.

**spam** Indicator for whether the email was spam.

**to\_multiple** Indicator for whether the email was addressed to more than one recipient.

**from** Whether the message was listed as from anyone (this is usually set by default for regular outgoing email).

**cc** Indicator for whether anyone was CCed.

**sent\_email** Indicator for whether the sender had been sent an email in the last 30 days.

**time** Time at which email was sent.

**image** The number of images attached.

**attach** The number of attached files.

**dollar** The number of times a dollar sign or the word “dollar” appeared in the email.

**winner** Indicates whether “winner” appeared in the email.

**inherit** The number of times “inherit” (or an extension, such as “inheritance”) appeared in the email.

**viagra** The number of times “viagra” appeared in the email.

**password** The number of times “password” appeared in the email.

**num\_char** The number of characters in the email, in thousands.

**line\_breaks** The number of line breaks in the email (does not count text wrapping).

**format** Indicates whether the email was written using HTML (e.g. may have included bolding or active links).

**re\_subj** Whether the subject started with “Re:”, “RE:”, “re:”, or “rE:”

**exclaim\_subj** Whether there was an exclamation point in the subject.

**urgent\_subj** Whether the word “urgent” was in the email subject.

**exclaim\_mess** The number of exclamation points in the email message.

**period\_mess** The number of periods in the message.

**signoff** Whether a sign-off of “Cheers”, “Regards”, or “Best” (also, “Best Regards”) was used.

**number** Factor variable saying whether there was no number, a small number (under 1 million), or a big number.

env\_regulation

*American Adults on Regulation and Renewable Energy*

---

### Description

Pew Research conducted a poll to find whether American adults support regulation or believe the private market will move the American economy towards renewable energy.

### Usage

```
env_regulation
```

### Format

A data frame with 705 observations on the following variable.

**statement** There were three possible outcomes for each person: “Regulations necessary”, “Private marketplace will ensure”, and “Don’t know”.

**Details**

The exact statements being selected were: (1) Government regulations are necessary to encourage businesses and consumers to rely more on renewable energy sources. (2) The private marketplace will ensure that businesses and consumers rely more on renewable energy sources, even without government regulations.

The actual sample size was 1012. However, the original data were not from a simple random sample; after accounting for the design, the equivalent sample size was about 705, which was what was used for the data set here to keep things simpler for intro stat analyses.

epa2012

**Description**

This data set comes from the 2005 Environmental Sustainability Index: Benchmarking National Environmental Stewardship. Countries are given an overall sustainability score as well as scores in each of several different environmental areas.

**Usage**

esi

**Format**

A data frame with 146 observations on the following 29 variables.

**code** ISO3 country code.

**country** Country.

**esi** Environmental Sustainability Index.

**system** ESI core component: systems

**stress** ESI core component: stresses

**vulner** ESI core component: vulnerability

**cap** ESI core component: capacity

**global** ESI core component: global stewardship

**sys\_air** Air quality.

**sys\_bio** Biodiversity.

**sys\_lan** Land.

**sys\_wql** Water quality.

**sys\_wqn** Water quantity.

**str\_air** Reducing air pollution.

**str\_eco** Reducing ecosystem stress.

**str\_pop** Reducing population pressure.

**str\_was** Reducing waste and consumption pressures.

**str\_wat** Reducing water stress.

**str\_nrm** Natural resource management.

**vul\_heal** Environmental health.

**vul\_sus** Basic human sustenance.

**vul\_dis** Exposure to natural disasters.

**cap\_gov** Environmental governance.

- cap\_eff** Eco-efficiency.
- cap\_pri** Private sector responsiveness.
- cap\_st** Science and technology.
- glo\_col** Participation in international collaboration efforts.
- glo\_ghg** Greenhouse gas emissions.
- glo\_tbp** Reducing transboundary environmental pressures.

## Details

ESI and Component scores are presented as standard normal percentiles. Indicator scores are in the form of z-scores. See Appendix A of the report for information on the methodology and Appendix C for more detail on original data sources.

For more information on how each of the indices were calculated, see the documentation linked below.

`ethanol`*Ethanol Treatment for Tumors Experiment*

---

**Description**

Experiment where 3 different treatments of ethanol were tested on the treatment of oral cancer tumors in hamsters.

**Usage**`ethanol`**Format**

A data frame with 24 observations, each representing one hamster, on the following 2 variables.

**treatment** Treatment the hamster received.

**regress** a factor with levels no yes

**Details**

The `ethyl_cellulose` and `pure_ethanol` treatments consisted of about a quarter of the volume of the tumors, while the `pure_ethanol_16x` treatment was 16x that, so about 4 times the size of the tumors.

**Source**

Morhard R, et al. 2017. Development of enhanced ethanol ablation as an alternative to surgery in treatment of superficial solid tumors. *Scientific Reports* 7:8750.

evals

*Professor evaluations and beauty***Description**

The data are gathered from end of semester student evaluations for 463 courses taught by a sample of 94 professors from the University of Texas at Austin. In addition, six students rate the professors' physical appearance. The result is a data frame where each row contains a different course and each column has information on the course and the professor who taught that course. <https://www.openintro.org/stat/data/?data=evals>

**Usage**

evals

**Format**

A data frame with 463 observations on the following 23 variables.

**course\_id** Variable identifying the course (out of 463 courses).

**prof\_id** Variable identifying the professor who taught the course (out of 94 professors).

**score** Average professor evaluation score: (1) very unsatisfactory - (5) excellent.

**rank** Rank of professor: teaching, tenure track, tenured.

**ethnicity** Ethnicity of professor: not minority, minority.

**gender** Gender of professor: female, male.

**language** Language of school where professor received education: English or non-English.

**age** Age of professor.

**cls\_perc\_eval** Percent of students in class who completed evaluation.

**cls\_did\_eval** Number of students in class who completed evaluation.

**cls\_students** Total number of students in class.

**cls\_level** Class level: lower, upper.

**cls\_profs** Number of professors teaching sections in course in sample: single, multiple.

**cls\_credits** Number of credits of class: one credit (lab, PE, etc.), multi credit.

**bty\_f1lower** Beauty rating of professor from lower level female: (1) lowest - (10) highest.

**bty\_f1upper** Beauty rating of professor from upper level female: (1) lowest - (10) highest.

**bty\_f2upper** Beauty rating of professor from second level female: (1) lowest - (10) highest.

**bty\_m1lower** Beauty rating of professor from lower level male: (1) lowest - (10) highest.

**bty\_m1upper** Beauty rating of professor from upper level male: (1) lowest - (10) highest.

**bty\_m2upper** Beauty rating of professor from second upper level male: (1) lowest - (10) highest.

**bty\_avg** Average beauty rating of professor.

**pic\_outfit** Outfit of professor in picture: not formal, formal.

**pic\_color** Color of professor's picture: color, black & white.

**Source**

**Examples**

```
evals
```

---

exams	<i>Exam scores</i>
-------	--------------------

---

**Description**

Exam scores from a class of 19 students.

**Usage**

```
exams
```

**Format**

A data frame with 19 observations on the following variable.

**scores** a numeric vector

**Examples**

```
hist(exams$scores)
```

---

exclusive_relationship	<i>Number of Exclusive Relationships</i>
------------------------	--

---

**Description**

A survey conducted on a reasonably random sample of 203 undergraduates asked, among many other questions, about the number of exclusive relationships these students have been in.

**Usage**

```
exclusive_relationship
```

**Format**

A data frame with 218 observations on the following variable.

**num** Number of exclusive relationships.

**Examples**

```
summary(exclusive_relationship$num)
table(exclusive_relationship$num)
hist(exclusive_relationship$num)
```

---

fadeColor	<i>Fade colors</i>
-----------	--------------------

---

**Description**

Fade colors so they are transparent.

**Usage**

```
fadeColor(col, fade = "FF")
```

**Arguments**

**col** An integer, color name, or RGB hexadecimal.

**fade** The amount to fade col. This value should be a character in hexadecimal from '00' to 'FF'. The smaller the value, the greater the fading.

**Author(s)**

David Diez

**Examples**

```
data(mariokart)

---

family\_college

*Simulated sample of parent / teen college attendance*

---

## Description

A simulated data set based on real population summaries.

## Usage

```
family_college
```

**Format**

A data frame with 792 observations on the following 2 variables.

**teen** Whether the teen goes to college or not.

**parents** Whether the parent holds a college degree or not.

**Source**

Simulation based off of summary information provided at <https://nces.ed.gov/pubs2001/2001126.pdf>.

**Examples**

```
library(dplyr)

family_college %>%
  count(teen, parents)
```

---

fastfood

*Nutrition in fast food*

---

**Description**

Nutrition amounts in 515 fast food items.

**Usage**

```
fastfood
```

**Format**

A data frame with 515 observations on the following 17 variables.

**restaurant** Name of restaurant

**item** Name of item

**calories** Number of calories

**cal\_fat** Calories from fat

**total\_fat** Total fat

**sat\_fat** Saturated fat

**trans\_fat** Trans fat

**cholesterol** Cholesterol

**sodium** Sodium

**total\_carb** Total carbs

**fiber** Fiber  
**sugar** Suger  
**protein** Protein  
**vit\_a** Vitamin A  
**vit\_c** Vitamin C  
**calcium** Calcium  
**salad** Salad or not

---

fcid	<i>Summary of male heights from USDA Food Commodity Intake Database</i>
------	---

---

### **Description**

Sample of heights based on the weighted sample in the survey.

### **Usage**

fcid

### **Format**

A data frame with 100 observations on the following 2 variables.

**height** a numeric vector

**num\_of\_adults** a numeric vector

### **Examples**

fcid

---

fheights	<i>Female college student heights, in inches</i>
----------	--

---

**Description**

24 sample observations.

**Usage**

```
fheights
```

**Format**

A data frame with 24 observations on the following variable.

**heights** height, in inches

**Examples**

```
hist(fheights$heights)
```

---

fish_oil_18	<i>Findings on n-3 Fatty Acid Supplement Health Benefits</i>
-------------	--

---

**Description**

The results summarize each of the health outcomes for an experiment where 12,933 subjects received a 1g fish oil supplement daily and 12,938 received a placebo daily. The experiment's duration was 5-years.

**Usage**

```
fish_oil_18
```

**Format**

The format is a list of 24 matrices. Each matrix is a 2x2 table, and below are the named items in the list, which also represent the outcomes.

**major\_cardio\_event** Major cardiovascular event. (Primary end point.)

**cardio\_event\_expanded** Cardiovascular event in expanded composite endpoint.

**myocardial\_infarction** Total myocardial infarction. (Heart attack.)

**stroke** Total stroke.

**cardio\_death** Death from cardiovascular causes.

**PCI** Percutaneous coronary intervention.

**CABG** Coronary artery bypass graft.

**total\_coronary\_heart\_disease** Total coronary heart disease.

**ischemic\_stroke** Ischemic stroke.

**hemorrhagic\_stroke** Hemorrhagic stroke.

**chd\_death** Death from coronary heart disease.

**myocardial\_infarction\_death** Death from myocardial infarction.

**stroke\_death** Death from stroke.

**invasive\_cancer** Invasive cancer of any type. (Primary end point.)

**breast\_cancer** Breast cancer.

**prostate\_cancer** Prostate cancer.

**colorectal\_cancer** Colorectal cancer.

**cancer\_death** Death from cancer.

**death** Death from any cause.

**major\_cardio\_event\_after\_2y** Major cardiovascular event, excluding the first 2 years of follow-up.

**myocardial\_infarction\_after\_2y** Total myocardial infarction, excluding the first 2 years of follow-up.

**invasive\_cancer\_after\_2y** Invasive cancer of any type, excluding the first 2 years of follow-up.

**cancer\_death\_after\_2y** Death from cancer, excluding the first 2 years of follow-up.

**death\_after\_2y** Death from any cause, excluding the first 2 years of follow-up.

---

friday

*Friday the 13th*

---

### Description

This data set addresses issues of how superstitions regarding Friday the 13th affect human behavior, and whether Friday the 13th is an unlucky day. Scanlon, et al. collected data on traffic and shopping patterns and accident frequency for Fridays the 6th and 13th between October of 1989 and November of 1992.

### Usage

friday

### Format

A data frame with 61 observations and 6 variables.

**type** Type of observation, traffic, shopping, or accident.

**date** Year and month of observation.

**sixth** Counts on the 6th of the month.

**thirteenth** Counts on the 13th of the month.

**diff** Difference between the sixth and the thirteenth.

**location** Location where data is collected.

### Details

There are three types of observations: traffic, shopping, and accident. For traffic, the researchers obtained information from the British Department of Transport regarding the traffic flows between junctions 7 to 8 and junctions 9 to 10 of the M25 motorway. For shopping, they collected the numbers of shoppers in nine different supermarkets in southeast England. For accidents, they collected numbers of emergency admissions to hospitals due to transport accidents.

### Source

---

full_body_scan	<i>Poll about use of full-body airport scanners</i>
----------------	---

---

## Description

Poll about use of full-body airport scanners, where about 4-in-5 people supported the use of the scanners.

## Usage

```
full_body_scan
```

## Format

A data frame with 1137 observations on the following 2 variables.

**answer** a factor with levels do not know / no answer should should not

**party.affiliation** a factor with levels Democrat Independent Republican

## Source

---

gear\_company      *Fake data for a gear company example*

---

**Description**

Made-up data for whether a sample of two gear companies' parts pass inspection.

**Usage**

gear\_company

**Format**

A data frame with 2000 observations on the following 2 variables.

**company** a factor with levels current prospective

**outcome** a factor with levels not pass

**Examples**

gear\_company

---

gender\_discrimination      *Bank manager recommendations based on gender*

---

**Description**

Study from the 1970s about whether gender influences hiring recommendations.

**Usage**

gender\_discrimination

**Format**

A data frame with 48 observations on the following 2 variables.

**gender** a factor with levels female male

**decision** a factor with levels not promoted

**Source**

Rosen B and Jerdee T. 1974. Influence of sex role stereotypes on personnel decisions. *Journal of Applied Psychology* 59(1):9-14.

get_it_dunn_run	<i>Get it Dunn Run, Race Times</i>
-----------------	------------------------------------

---

## Description

Get it Dunn is a small regional run that got extra attention when a runner, Nichole Porath, made the Guinness Book of World Records for the fastest time pushing a double stroller in a half marathon.

## Usage

```
get_it_dunn_run
```

## Format

A data frame with 978 observations on the following 10 variables.

**date** Date of the run.  
**race** Run distance.  
**bib\_num** Bib number of the runner.  
**first\_name** First name of the runner.  
**last\_initial** Initial of the runner's last name.  
**sex** Sex of the runner.  
**age** Age of the runner.  
**city** City of residence.  
**state** State of residence.  
**run\_time\_minutes** Run time, in minutes.

## Source

<http://www.getitdunnrun.com>

plot(m$residuals ~ d$age)
hist(m$residuals)
```

---

 gifted

---

*Analytical skills of young gifted children*

---

**Description**

An investigator is interested in understanding the relationship, if any, between the analytical skills of young gifted children and the following variables: father's IQ, mother's IQ, age in month when the child first said "mummy" or "daddy", age in month when the child first counted to 10 successfully, average number of hours per week the child's mother or father reads to the child, average number of hours per week the child watched an educational program on TV during the past three months, average number of hours per week the child watched cartoons on TV during the past three months. The analytical skills are evaluated using a standard testing procedure, and the score on this test is used as the response variable.

**Usage**

```
gifted
```

**Format**

A data frame with 36 observations and 8 variables.

**score** Score in test of analytical skills.

**fatheriq** Father's IQ.

**motheriq** Mother's IQ.

**speak** Age in months when the child first said "mummy" or "daddy".

**count** Age in months when the child first counted to 10 successfully.

**read** Average number of hours per week the child's mother or father reads to the child.

**edutv** Average number of hours per week the child watched an educational program on TV during the past three months.

**cartoons** Average number of hours per week the child watched cartoons on TV during the past three months.

**Details**

Data were collected from schools in a large city on a set of thirty-six children who were identified as gifted children soon after they reached the age of four.

`goog`*Google stock data*

---

**Description**

Google stock data from 2006 to early 2014, where data from the first day each month was collected.

**Usage**`goog`**Format**

A data frame with 98 observations on the following 7 variables.

**date** a factor with levels 2006-01-03, 2006-02-01, and so on

**open** a numeric vector

**high** a numeric vector

**low** a numeric vector

**close** a numeric vector

**volume** a numeric vector

**adj\_close** a numeric vector

**Source**

Yahoo! Finance.

**Examples**`goog`

---

`gov_poll`*Pew Research poll on government approval ratings*

---

**Description**

The poll's focus is on Obama and then Democrats and Republicans in Congress.

**Usage**`gov_poll`

**Format**

A data frame with 4223 observations on the following 2 variables.

**poll** a factor with levels approve disapprove

**eval** a factor with levels Democrats Obama Republicans

**Source**

See the Pew Research website: [www.people-press.org/2012/03/14/romney-leads-gop-contest-trails-in-matchup-with-obama](http://www.people-press.org/2012/03/14/romney-leads-gop-contest-trails-in-matchup-with-obama). The counts in Table 6.19 are approximate.

**Examples**

```
gov_poll
```

---

gpa

*Survey of Duke students on GPA, studying, and more*

---

**Description**

A survey of 55 Duke University students asked about their GPA, number of hours they study at night, number of nights they go out, and their gender.

**Usage**

```
gpa
```

**Format**

A data frame with 55 observations on the following 5 variables.

**gpa** a numeric vector

**studyweek** a numeric vector

**sleepnight** a numeric vector

**out** a numeric vector

**gender** a factor with levels female male

**Examples**

```
gpa
```

---

gpa_iq	<i>Sample of students and their GPA and IQ</i>
--------	--

---

**Description**

Data on 78 students including GPA, IQ, and gender.

**Usage**

```
gpa_iq
```

**Format**

A data frame with 78 observations representing students on the following 5 variables.

**obs** a numeric vector

**gpa** Grade point average (GPA).

**iq** IQ.

**gender** Gender.

**concept** a numeric vector

**Examples**

```
gpa_iq
```

---

gpa_study_hours	<i>gpa_study_hours</i>
-----------------	------------------------

---

**Description**

A data frame with 193 rows and 2 columns. The columns represent the variables gpa and study\_hours for a sample of 193 undergraduate students who took an introductory statistics course in 2012 at a private US university.

**Usage**

```
gpa_study_hours
```

**Format**

A data frame with 193 observations on the following 2 variables.

**gpa** Grade point average (GPA) of student.

**study\_hours** Number of hours students study per week.

## Details

GPA ranges from 0 to 4 points, however one student reported a GPA > 4. This is a data error but this observation has been left in the dataset as it is used to illustrate issues with real survey data. Both variables are self reported, hence may not be accurate.

## Source

Collected at a private US university as part of an anonymous survey in an introductory statistics course.

## Examples

```
library(ggplot2)

ggplot(gpa_study_hours, aes(x = study_hours, y = gpa)) +
  geom_point(alpha = 0.5) +
  labs(x = "Study hours/week", y = "GPA")
```

---

gradestv	<i>Simulated data for analyzing the relationship between watching TV and grades</i>
----------	---

---

## Description

This is a simulated data set to be used to estimate the relationship between number of hours per week students watch TV and the grade they got in a statistics class.

## Usage

```
gradestv
```

## Format

A data frame with 25 observations on the following 2 variables.

**tv** Number of hours per week students watch TV.

**grades** Grades students got in a statistics class (out of 100).

## Details

There are a few potential outliers in this data set. When analyzing the data one should consider how (if at all) these outliers may affect the estimates of correlation coefficient and regression parameters.

## Source

Simulated data

## Examples

```
library(ggplot2)

ggplot(gradedtv, aes(x = tv, y = grades)) +
  geom_point() +
  geom_smooth(method = "lm")
```

---

gsearch

*Simulated Google search experiment*

---

## Description

The data were simulated to look like sample results from a Google search experiment.

## Usage

```
gsearch
```

## Format

A data frame with 10000 observations on the following 2 variables.

**type** a factor with levels new search no new search

**outcome** a factor with levels current test 1 test 2

## Examples

```
library(ggplot2)

table(gsearch$type, gsearch$outcome)

ggplot(gsearch, aes(x = type, fill = outcome)) +
  geom_bar(position = "fill") +
  labs(y = "proportion")
```

---

gss2010

2010 General Social Survey

---

**Description**

Data from the 2010 General Social Survey.

**Usage**

gss2010

**Format**

A data frame with 2044 observations on the following 5 variables.

**hrsrelax** After an average work day, about how many hours do you have to relax or pursue activities that you enjoy

**mntlhlth** For how many days during the past 30 days was your mental health, which includes stress, depression, and problems with emotions, not good?

**hrs1** Hours worked each week.

**degree** Educational attainment or degree.

**grass** Do you think the use of marijuana should be made legal, or not?

**Source**

US 2010 General Social Survey.

**Examples**

gss2010

---

healthcare\_law\_survey *Pew Research Center poll on health care, including question variants*

---

**Description**

For example, Pew Research Center conducted a survey with the following question: "As you may know, by 2014 nearly all Americans will be required to have health insurance. People who do not buy insurance will pay a penalty while people who cannot afford it will receive financial help from the government. Do you approve or disapprove of this policy?" For each randomly sampled respondent, the statements in brackets were randomized: either they were kept in the order given above, or the two statements were reversed.

**Usage**

healthcare\_law\_survey

**Format**

A data frame with 1503 observations on the following 2 variables.

**order** a factor with levels cannot\_afford\_second penalty\_second

**response** a factor with levels approve disapprove other

**Source**

[www.people-press.org/2012/03/26/public-remains-split-on-health-care-bill-opposed-to-mandate/](http://www.people-press.org/2012/03/26/public-remains-split-on-health-care-bill-opposed-to-mandate/). Sample sizes for each polling group are approximate.

**Examples**

healthcare\_law\_survey

---

health\_coverage

*Health Coverage and Health Status*

---

**Description**

Survey responses for 20,000 responses to the Behavioral Risk Factor Surveillance System.

**Usage**

health\_coverage

**Format**

A data frame with 20000 observations on the following 2 variables.

**coverage** Whether the person had health coverage or not.

**health\_status** The person's health status.

**Source**

Office of Surveillance, Epidemiology, and Laboratory Services Behavioral Risk Factor Surveillance System, BRFSS 2010 Survey Data.

## Examples

```
table(health_coverage)
```

---

heart_transplant	<i>Heart Transplant Data</i>
------------------	------------------------------

---

## Description

The Stanford University Heart Transplant Study was conducted to determine whether an experimental heart transplant program increased lifespan. Each patient entering the program was designated officially a heart transplant candidate, meaning that he was gravely ill and would most likely benefit from a new heart. Then the actual heart transplant occurs between a few weeks to several months depending on the availability of a donor. Very few candidates during this waiting period show improvement and get *deselected* as a heart transplant candidate, but for the purposes of this experiment those patients were kept in the data as continuing candidates.

## Usage

```
heart_transplant
```

## Format

A data frame with 103 observations on the following 8 variables.

**id** ID number of the patient.

**acceptyear** Year of acceptance as a heart transplant candidate.

**age** Age of the patient at the beginning of the study.

**survived** Survival status with levels *alive* and *dead*.

**survtime** Number of days patients were alive after the date they were determined to be a candidate for a heart transplant until the termination date of the study

**prior** Whether or not the patient had prior surgery with levels *yes* and *no*.

**transplant** Transplant status with levels *control* (did not receive a transplant) and *treatment* (received a transplant).

**wait** Waiting Time for Transplant

## Source

  geom_bar(position = "fill") +
  labs(x = "Transplant", y = "Proportion", fill = "Outcome")
```

---

helium

*Helium football*

---

## Description

At the 1976 Pro Bowl, Ray Guy, a punter for the Oakland Raiders, punted a ball that hung mid-air long enough for officials to question whether the pigskin was filled with helium. The ball was found to be filled with air, but since then many have tossed around the idea that a helium-filled football would outdistance an air-filled one. Students at Ohio State University conducted an experiment to test this myth. They used two identical footballs, one air filled with air and one filled with helium. Each football was kicked 39 times and the two footballs were alternated with each kick.

## Usage

```
helium
```

## Format

A data frame with 39 observations on the following 3 variables.

**trial** Trial number.

**air** Distance in years for air-filled football.

**helium** Distance in years for helium-filled football.

## Details

Lafferty, M. B. (1993), "OSU scientists get a kick out of sports controversy, "The Columbus Dispatch (November, 21, 1993), B7.

## Source

boxPlot(helium$helium, xlab = "helium")
```

---

helmet

*Socioeconomic status and reduced-fee school lunches*

---

## Description

Examining the relationship between socioeconomic status measured as the percentage of children in a neighborhood receiving reduced-fee lunches at school (lunch) and the percentage of bike riders in the neighborhood wearing helmets (helmet).

## Usage

```
helmet
```

## Format

A data frame with 12 observations representing neighborhoods on the following 2 variables.

**lunch** Percent of students receiving reduced-fee school lunches.

**helmet** Percent of bike riders wearing helmets.

## Examples

```
library(ggplot2)

ggplot(helmet, aes(x = lunch, y = helmet)) +
  geom_point()
```

hfi

*Absenteeism***Description**

The Human Freedom Index is a report that attempts to summarize the idea of "freedom" through a bunch of different variables for many countries around the globe. It serves as a rough objective measure for the relationships between the different types of freedom - whether it's political, religious, economical or personal freedom - and other social and economic circumstances. The Human Freedom Index is an annually co-published report by the Cato Institute, the Fraser Institute, and the Liberales Institut at the Friedrich Naumann Foundation for Freedom.

**Usage**

hfi

**Format**

A data frame with 1458 observations on the following 123 variables.

**year** Year

**ISO\_code** ISO code of country

**countries** Name of country

**region** Region where country is located

**pf\_rol\_procedural** Procedural justice

**pf\_rol\_civil** Civil justice

**pf\_rol\_criminal** Criminal justice

**pf\_rol** Rule of law

**pf\_ss\_homicide** Homicide

**pf\_ss\_disappearances\_disap** Disappearances

**pf\_ss\_disappearances\_violent** Violent conflicts

**pf\_ss\_disappearances\_organized** Violent conflicts

**pf\_ss\_disappearances\_fatalities** Terrorism fatalities

**pf\_ss\_disappearances\_injuries** Terrorism injuries

**pf\_ss\_disappearances** Disappearances, conflict, and terrorism

**pf\_ss\_women\_fgm** Female genital mutilation

**pf\_ss\_women\_missing** Missing women

**pf\_ss\_women\_inheritance\_widows** Inheritance rights for widows

**pf\_ss\_women\_inheritance\_daughters** Inheritance rights for daughters

**pf\_ss\_women\_inheritance** Inheritance

**pf\_ss\_women** Women's security

**pf\_ss** Security and safety  
**pf\_movement\_domestic** Freedom of domestic movement  
**pf\_movement\_foreign** Freedom of foreign movement  
**pf\_movement\_women** Women's movement  
**pf\_movement** Freedom of movement  
**pf\_religion\_estop\_establish** Freedom to establish religious organizations  
**pf\_religion\_estop\_operate** Freedom to operate religious organizations  
**pf\_religion\_estop** Freedom to establish and operate religious organizations  
**pf\_religion\_harassment** Harassment and physical hostilities  
**pf\_religion\_restrictions** Legal and regulatory restrictions  
**pf\_religion** Religious freedom  
**pf\_association\_association** Freedom of association  
**pf\_association\_assembly** Freedom of assembly  
**pf\_association\_political\_establish** Freedom to establish political parties  
**pf\_association\_political\_operate** Freedom to operate political parties  
**pf\_association\_political** Freedom to establish and operate political parties  
**pf\_association\_prof\_establish** Freedom to establish professional organizations  
**pf\_association\_prof\_operate** Freedom to operate professional organizations  
**pf\_association\_prof** Freedom to establish and operate professional organizations  
**pf\_association\_sport\_establish** Freedom to establish educational, sporting, and cultural organizations  
**pf\_association\_sport\_operate** Freedom to operate educational, sporting, and cultural organizations  
**pf\_association\_sport** Freedom to establish and operate educational, sporting, and cultural organizations  
**pf\_association** Freedom to associate and assemble with peaceful individuals or organizations  
**pf\_expression\_killed** Press killed  
**pf\_expression\_jailed** Press jailed  
**pf\_expression\_influence** Laws and regulations that influence media content  
**pf\_expression\_control** Political pressures and controls on media content  
**pf\_expression\_cable** Access to cable/satellite  
**pf\_expression\_newspapers** Access to foreign newspapers  
**pf\_expression\_internet** State control over internet access  
**pf\_expression** Freedom of expression  
**pf\_identity\_legal** Legal gender  
**pf\_identity\_parental\_marriage** Parental rights in marriage  
**pf\_identity\_parental\_divorce** Parental rights after divorce  
**pf\_identity\_parental** Parental rights

**pf\_identity\_sex\_male** Male-to-male relationships  
**pf\_identity\_sex\_female** Female-to-female relationships  
**pf\_identity\_sex** Same-sex relationships  
**pf\_identity\_divorce** Divor  
**pf\_identity** Identity and relationships  
**pf\_score** Personal Freedom (score)  
**pf\_rank** Personal Freedom (rank)  
**ef\_government\_consumption** Government consumption  
**ef\_government\_transfers** Transfers and subsidies  
**ef\_government\_enterprises** Government enterprises and investments  
**ef\_government\_tax\_income** Top marginal income tax rate - Top marginal income tax rates  
**ef\_government\_tax\_payroll** Top marginal income tax rate - Top marginal income and payroll tax rate  
**ef\_government\_tax** Top marginal tax rate  
**ef\_government** Size of government  
**ef\_legal\_judicial** Judicial independence  
**ef\_legal\_courts** Impartial courts  
**ef\_legal\_protection** Protection of property rights  
**ef\_legal\_military** Military interference in rule of law and politics  
**ef\_legal\_integrity** Integrity of the legal system  
**ef\_legal\_enforcement** Legal enforcement of contracts  
**ef\_legal\_restrictions** Regulatory restrictions on the sale of real property  
**ef\_legal\_police** Reliability of police  
**ef\_legal\_crime** Business costs of crime  
**ef\_legal\_gender** Gender adjustment  
**ef\_legal** Legal system and property rights  
**ef\_money\_growth** Money growth  
**ef\_money\_sd** Standard deviation of inflation  
**ef\_money\_inflation** Inflation - most recent year  
**ef\_money\_currency** Freedom to own foreign currency bank account  
**ef\_money** Sound money  
**ef\_trade\_tariffs\_revenue** Tariffs - Revenue from trade taxes (percentage of trade sector)  
**ef\_trade\_tariffs\_mean** Tariffs - Mean tariff rate  
**ef\_trade\_tariffs\_sd** Tariffs - Standard deviation of tariffs rates  
**ef\_trade\_tariffs** Tariffs  
**ef\_trade\_regulatory\_nontariff** Regulatory trade barriers - Nontariff trade barriers  
**ef\_trade\_regulatory\_compliance** Regulatory trade barriers - Compliance costs of importing and exporting

**ef\_trade\_regulatory** Regulatory trade barriers  
**ef\_trade\_black** Black-market exchange rates  
**ef\_trade\_movement\_foreign** Controls of the movement of capital and people - Foreign ownership/investment restrictions  
**ef\_trade\_movement\_capital** Controls of the movement of capital and people - Capital controls  
**ef\_trade\_movement\_visit** Controls of the movement of capital and people - Freedom of foreigners to visit  
**ef\_trade\_movement** Controls of the movement of capital and people  
**ef\_trade** Freedom to trade internationally  
**ef\_regulation\_credit\_ownership** Credit market regulations - Ownership of banks  
**ef\_regulation\_credit\_private** Credit market regulations - Private sector credit  
**ef\_regulation\_credit\_interest** Credit market regulations - Interest rate controls/negative real interest rates  
**ef\_regulation\_credit** Credit market regulation  
**ef\_regulation\_labor\_minwage** Labor market regulations - Hiring regulations and minimum wage  
**ef\_regulation\_labor\_firing** Labor market regulations - Hiring and firing regulations  
**ef\_regulation\_labor\_bargain** Labor market regulations - Centralized collective bargaining  
**ef\_regulation\_labor\_hours** Labor market regulations - Hours regulations  
**ef\_regulation\_labor\_dismissal** Labor market regulations - Dismissal regulations  
**ef\_regulation\_labor\_conscription** Labor market regulations - Conscription  
**ef\_regulation\_labor** Labor market regulation  
**ef\_regulation\_business\_adm** Business regulations - Administrative requirements  
**ef\_regulation\_business\_bureaucracy** Business regulations - Bureaucracy costs  
**ef\_regulation\_business\_start** Business regulations - Starting a business  
**ef\_regulation\_business\_bribes** Business regulations - Extra payments/bribes/favoritism  
**ef\_regulation\_business\_licensing** Business regulations - Licensing restrictions  
**ef\_regulation\_business\_compliance** Business regulations - Cost of tax compliance  
**ef\_regulation\_business** Business regulation  
**ef\_regulation** Economic freedom regulation score  
**ef\_score** Economic freedom score  
**ef\_rank** Economic freedom rank  
**hf\_score** Human freedom score  
**hf\_rank** Human freedom rank  
**hf\_quartile** Human freedom quartile

## Details

This dataset contains information from Human Freedom Index reports from 2008-2016.

---

 histPlot

*Histogram or hollow histogram*

---

**Description**

Create histograms and hollow histograms. This function permits easy color and appearance customization.

**Usage**

```
histPlot(
  x,
  col = fadeColor("black", "22"),
  border = "black",
  breaks = "default",
  probability = FALSE,
  hollow = FALSE,
  add = FALSE,
  lty = 2,
  lwd = 1,
  freqTable = FALSE,
  right = TRUE,
  axes = TRUE,
  xlab = NULL,
  ylab = NULL,
  xlim = NULL,
  ylim = NULL,
  ...
)
```

**Arguments**

x	Numerical vector or a frequency table (matrix) where the first column represents the observed values and the second column the frequencies. See also <code>freqTable</code> argument.
col	Shading of the histogram bins.
border	Color of histogram bin borders.
breaks	A vector for the bin boundaries or an approximate number of bins.

probability	If FALSE, the frequency is plotted. If TRUE, then a probability density.
hollow	If TRUE, a hollow histogram will be created.
add	If TRUE, the histogram is added to the plot.
lty	Line type. Applies only if hollow=TRUE.
lwd	Line width. Applies only if hollow=TRUE.
freqTable	Set to TRUE if x is a frequency table.
right	Set to FALSE to assign values of x that fall on a bin margin to the left bin. Otherwise the ties default to the right bin.
axes	If FALSE, the axes are not plotted.
xlab	Label for the x axis.
ylab	Label for the y axis.
xlim	Limits for the x axis.
ylim	Limits for the y axis.
...	Additional arguments to plot. If add is TRUE, these arguments are ignored.

**Examples**

```
histPlot(tips$tip, main = "Tips")

# overlaid hollow histograms
histPlot(tips$tip[tips$day == "Tuesday"],
         probability = TRUE,
         hollow = TRUE,
         main = "Tips by day")
histPlot(tips$tip[tips$day == "Friday"],
         probability = TRUE,
         hollow = TRUE,
         add = TRUE,
         lty = 3,
         border = "red")
legend("topright",
      col = c("black", "red"),
      lty = 1:2,
      legend = c("Tuesday", "Friday"))

# breaks and colors
histPlot(tips$tip,
```

```

col = fadeColor("yellow", "33"),
border = "darkblue",
probability = TRUE,
breaks = 30,
lwd = 3)

# custom breaks
brks <- c(-1, 0, 1, 2, 3, 4, seq(5, 20, 5), 22, 24, 26)
histPlot(tips$tip,
         probability = TRUE,
         breaks = brks,
         col = fadeColor("darkgoldenrod4", "33"),
         xlim = c(0, 26))

```

---

house

*United States House of Representatives historical make-up*

---

### Description

The make-up of the United States House of Representatives every two years since 1789. The last Congress included is the 112th Congress, which completed its term in 2013.

### Usage

```
house
```

### Format

A data frame with 112 observations on the following 12 variables.

**congress** The number of that year's Congress  
**year\_start** Starting year  
**year\_end** Ending year  
**seats** Total number of seats  
**p1** Name of the first political party  
**np1** Number of seats held by the first political party  
**p2** Name of the second political party  
**np2** Number of seats held by the second political party  
**other** Other  
**vac** Vacancy  
**del** Delegate  
**res** Resident commissioner

**Source**

Party Divisions of the House of Representatives, 1789 to Present. <https://history.house.gov/Institution/Party-Divisions/Party-Divisions>.

**Examples**

```

  labs(x = "Year", y = "Percentage of seats", fill = "Era")
```

**Description**

Each observation represents a simulated rent price for a student.

**Usage**

housing

**Format**

A data frame with 75 observations on the following variable.

**cost** a numeric vector

**Examples**

housing

---

hsb2

*High School and Beyond survey*

---

**Description**

Two hundred observations were randomly sampled from the High School and Beyond survey, a survey conducted on high school seniors by the National Center of Education Statistics.

**Usage**

hsb2

**Format**

A data frame with 200 observations and 11 variables.

**id** Student ID.

**gender** Student's gender, with levels female and male.

**race** Student's race, with levels african american, asian, hispanic, and white.

**ses** Socio economic status of student's family, with levels low, middle, and high.

**schtyp** Type of school, with levels public and private.

**prog** Type of program, with levels general, academic, and vocational.

**read** Standardized reading score.

**write** Standardized writing score.

**math** Standardized math score.

**science** Standardized science score.

**socst** Standardized social studies score.

**Source**

UCLA Institute for Digital Research & Education - Statistical Consulting.

**Examples**

```
library(ggplot2)

ggplot(hsb2, aes(x = read - write, y = ses)) +
  geom_boxplot() +
  labs(
    x = "Difference between reading and writing scores",
    y = "Socio-economic status"
  )
```

---

husbands\_wives

*Great Britain: husband and wife pairs*

---

**Description**

The Great Britain Office of Population Census and Surveys once collected data on a random sample of 170 married couples in Britain, recording the age (in years) and heights of the husbands and wives.

**Usage**

```
husbands_wives
```

**Format**

A data frame with 199 observations on the following 8 variables.

**age\_husband** Age of husband.

**age\_wife** Age of wife.

**ht\_husband** Height of husband (mm).

**ht\_wife** Height of wife (mm).

**age\_husb\_at\_marriage** Age of husband at the time they married.

**age\_wife\_at\_marriage** Age of wife at the time they married.

**years\_married** Number of years married.

**Source**

Hand DJ. 1994. A handbook of small data sets. Chapman & Hall/CRC.

## Examples

```
library(ggplot2)

ggplot(husbands_wives, aes(x = ht_husband, y = ht_wife)) +
  geom_point()
```

---

immigration

*Poll on illegal workers in the US*

---

## Description

910 randomly sampled registered voters in Tampa, FL were asked if they thought workers who have illegally entered the US should be (i) allowed to keep their jobs and apply for US citizenship, (ii) allowed to keep their jobs as temporary guest workers but not allowed to apply for US citizenship, or (iii) lose their jobs and have to leave the country as well as their political ideology.

## Usage

```
immigration
```

## Format

A data frame with 910 observations on the following 2 variables.

**response** a factor with levels Apply for citizenship Guest worker Leave the country Not sure

**political** a factor with levels conservative liberal moderate

## Source

SurveyUSA, News Poll #18927, data collected Jan 27-29, 2012.

## Examples

```
immigration
```

---

infmortrate	<i>Infant Mortality Rates, 2012</i>
-------------	-------------------------------------

---

### Description

This entry gives the number of deaths of infants under one year old in 2012 per 1,000 live births in the same year. This rate is often used as an indicator of the level of health in a country.

### Usage

```
infmortrate
```

### Format

A data frame with 222 observations on the following 2 variables.

**country** Name of country.

**inf\_mort\_rate** Infant mortality rate per 1,000 live births.

### Details

The data is given in decreasing order of infant mortality rates. There are a few potential outliers.

### Source

CIA World Factbook, [https://www.cia.gov/library/publications/the-world-factbook/rankorder/rawdata\\_2091.txt](https://www.cia.gov/library/publications/the-world-factbook/rankorder/rawdata_2091.txt).

### Examples

```
library(ggplot2)

ggplot(infmortrate, aes(x = inf_mort_rate)) +
  geom_histogram(binwidth = 10)

ggplot(infmortrate, aes(x = inf_mort_rate)) +
  geom_density()
```

---

ipo

*Facebook, Google, and LinkedIn IPO filings*

---

### Description

On Feb 1st, 2011, Facebook Inc. filed an S-1 form with the Securities and Exchange Commission as part of their initial public offering (IPO). This dataset includes the text of that document as well as text from the IPOs of two competing companies: Google and LinkedIn.

### Usage

ipo

### Format

The format is a list of three character vectors. Each vector contains the line-by-line text of the IPO Prospectus of Facebook, Google, and LinkedIn, respectively.

### Details

Each of the three prospectuses is encoded in UTF-8 format and contains some non-word characters related to the layout of the original documents. For analysis on the words, it is recommended that the data be processed with packages such as `tm` and `stringr`. See example below.

### Source

All IPO prospectuses are available from the U.S. Securities and Exchange Commission: [Facebook](#), [Google](#), [LinkedIn](#).

### References

Zweig, J., 2020. Mark Zuckerberg: CEO For Life?. WSJ. Available at: <http://blogs.wsj.com/totalreturn/2012/02/06/mark-zuckerberg-ceo-for-life>.

### Examples

```
## Not run:
library(tm)
library(wordcloud)

# pre-process data
corp <- Corpus(VectorSource(ipo), readerControl=list(language="en"))
corp <- tm_map(corp, removePunctuation)
corp <- tm_map(corp, tolower)
corp <- tm_map(corp, removeNumbers)
corp <- tm_map(corp, function(x)removeWords(x,stopwords()))
f <- corp[1] # facebook
g <- corp[2] # google
```

```
l <- corp[3] # linkedin

tmat <- TermDocumentMatrix(f)
m <- as.matrix(tmat)
freq <- rowSums(m)
words <- rownames(m)
words.ord <- sort.int(freq, decreasing = T, index.return = F)
barplot(words.ord[1:15], las = 2)

wordcloud(words, freq, min.freq = 100, col='blue')

tmat <- TermDocumentMatrix(c(f, g))
m <- as.matrix(tmat)
comparison.cloud(m, max.words = 100)

## End(Not run)
```

---

ipod *Length of songs on an iPod*

---

### Description

A simulated data set on lengths of songs on an iPod.

### Usage

```
ipod
```

### Format

A data frame with 3000 observations on the following variable.

**song\_length** Length of song (in minutes).

### Source

Simulated data.

### Examples

```
library(ggplot2)

ggplot(ipod, aes(x = song_length)) +
  geom_histogram(binwidth = 0.5)
```

---

jury	<i>Simulated juror data set</i>
------	---------------------------------

---

**Description**

Simulated data set of registered voters proportions and representation on juries.

**Usage**

jury

**Format**

A data frame with 275 observations on the following variable.

**race** a factor with levels black hispanic other white

**Examples**

jury

---

kobe_basket	<i>Kobe Bryant basketball performance</i>
-------------	---

---

**Description**

Data from the five games the Los Angeles Lakers played against the Orlando Magic in the 2009 NBA finals.

**Usage**

kobe\_basket

**Format**

A data frame with 133 rows and 6 variables:

**vs** A categorical vector, ORL if the Los Angeles Lakers played against Orlando

**game** A numerical vector, game in the 2009 NBA finals

**quarter** A categorical vector, quarter in the game, OT stands for overtime

**time** A character vector, time at which Kobe took a shot

**description** A character vector, description of the shot

**shot** A categorical vector, H if the shot was a hit, M if the shot was a miss

## Details

Each row represents a shot Kobe Bryant took during the five games of the 2009 NBA finals. Kobe Bryant's performance earned him the title of Most Valuable Player and many spectators commented on how he appeared to show a hot hand.

---

lab\_report

*lab\_report*

---

## Description

Acts as a simplified template to common parameters passed to `rmarkdown::html_document()`.

## Usage

```
lab_report(
  highlight = "pygments",
  theme = "spacelab",
  toc = TRUE,
  toc_float = TRUE,
  code_download = TRUE,
  code_folding = "show"
)
```

## Arguments

highlight	Syntax highlighting style. Supported styles include "default", "tango", "pygments", "kate", "monochrome", "espresso", "zenburn", "haddock", and "textmate". Pass 'NULL' to prevent syntax highlighting.
theme	Visual theme ("default", "cerulean", "journal", "flatly", "readable", "spacelab", "united", "cosmo", "lumen", "paper", "sandstone", "simplex", or "yeti"). Pass 'NULL' for no theme (in this case you can use the 'css' parameter to add your own styles).
toc	'TRUE' to include a table of contents in the output
toc_float	'TRUE' to float the table of contents to the left of the main document content. Rather than 'TRUE' you may also pass a list of options that control the behavior of the floating table of contents. See the <i>*Floating Table of Contents*</i> section below for details.
code_download	Embed the Rmd source code within the document and provide a link that can be used by readers to download the code.
code_folding	Enable document readers to toggle the display of R code chunks. Specify "none" to display all code chunks (assuming they were knit with 'echo = TRUE'). Specify "hide" to hide all R code chunks by default (users can show hidden code chunks either individually or document-wide). Specify "show" to show all R code chunks by default.

law\_resume

*Gender, Socioeconomic Class, and Interview Invites***Description**

Resumes were sent out to 316 top law firms in the United States, and there were two randomized characteristics of each resume. First, the gender associated with the resume was randomized by assigning a first name of either James or Julia. Second, the socioeconomic class of the candidate was randomly assigned and represented through five minor changes associated with personal interests and other other minor details (e.g. an extracurricular activity of sailing team vs track and field). The outcome variable was whether the candidate was received an interview.

**Usage**

```
law_resume
```

**Format**

A data frame with 316 observations on the following 3 variables. Each row represents a resume sent a top law firm for this experiment.

**class** The resume represented irrelevant details suggesting either "low" or "high" socioeconomic class.

**gender** The resume implied the candidate was either "male" or "female".

**outcome** If the candidate received an invitation for an "interview" or "not".

**Source**

For a casual overview, see <https://hbr.org/2016/12/research-how-subtle-class-cues-can-backfire-on-your-re>

For the academic paper, see Tilcsik A, Rivera LA. 2016. Class Advantage, Commitment Penalty. The Gendered Effect of Social Class Signals in an Elite Labor Market. *American Sociological Review* 81:6 p1097-1131. <https://journals.sagepub.com/doi/abs/10.1177/0003122416668154>.

**Examples**

```
tapply(law_resume$outcome == "interview", law_resume[, c("class", "gender")], mean)
m <- glm(I(outcome == "interview") ~ gender * class, data = law_resume, family = binomial)
summary(m)
predict(m, type = "response")
```

---

`leg_mari`*Legalization of Marijuana Support in 2010 California Survey*

---

**Description**

In a 2010 Survey USA poll, 70 and 34 said they would vote in the 2010 general election for Prop 19, which would change California law to legalize marijuana and allow it to be regulated and taxed.

**Usage**`leg_mari`**Format**

A data frame with 119 observations on the following variable.

**response** One of two values: oppose or support.

**Source**

Survey USA, Election Poll #16804, data collected July 8-11, 2010.

**Examples**

```
table(leg_mari)
```

---

`linResPlot`*Create simple regression plot with residual plot*

---

**Description**

Create a simple regression plot with residual plot.

**Usage**

```
linResPlot(  
  x,  
  y,  
  axes = FALSE,  
  wBox = TRUE,  
  wLine = TRUE,  
  lCol = "#00000088",  
  lty = 1,
```

```
    lwd = 1,  
    main = "",  
    xlab = "",  
    ylab = "",  
    marRes = NULL,  
    col = fadeColor(4, "88"),  
    pch = 20,  
    cex = 1.5,  
    yR = 0.1,  
    ylim = NULL,  
    subset = NULL,  
    ...  
  )
```

### Arguments

x	Predictor variable.
y	Outcome variable.
axes	Whether to plot axis labels.
wBox	Whether to plot boxes around each plot.
wLine	Add a regression line.
lCol	Line color.
lty	Line type.
lwd	Line width.
main	Title for the top plot.
xlab	x-label.
ylab	y-label.
marRes	Margin for the residuals plot.
col	Color of the points.
pch	Plotting character of points.
cex	Size of points.
yR	An additional vertical stretch factor on the plot.
ylim	y-limits.
subset	Boolean vector, if wanting a subset of the data.
...	Additional arguments passed to both plots.

```

---

lmPlot

*Linear regression plot with residual plot*

---

## Description

Plot data, the linear model, and a residual plot simultaneously.

## Usage

```
lmPlot(
  x,
  y,
  xAxis = 0,
  yAxis = 4,
  resAxis = 3,
  resSymm = TRUE,
  wBox = TRUE,
  wLine = TRUE,
  lCol = "#00000088",
  lty = 1,
  lwd = 1,
  xlab = "",
  ylab = "",
  marRes = NULL,
  col = "#22558888",
  pch = 20,
  cex = 1.5,
  xR = 0.02,
  yR = 0.1,
  xlim = NULL,
  ylim = NULL,
  subset = NULL,
  parCustom = FALSE,
```

```

myHeight = c(1, 0.45),
plots = c("both", "mainOnly", "resOnly"),
highlight = NULL,
hlCol = NULL,
hlCex = 1.5,
hlPch = 20,
na.rm = TRUE,
...
)

```

### Arguments

x	The x coordinates of points in the plot.
y	The y coordinates of points in the plot.
xAxis	The maximum number of x axis labels.
yAxis	The maximum number of y axis labels.
resAxis	The maximum number of y axis labels in the residual plot.
resSymm	Boolean determining whether the range of the residual plot should be symmetric about zero.
wBox	Boolean determining whether a box should be added around each plot.
wLine	Boolean determining whether to add a regression line to the plot.
lCol	The color of the regression line to be added.
lty	The line type of the regression line to be added.
lwd	The line width of the regression line to be added.
xlab	A label for the x axis.
ylab	A label for the y axis
marRes	Margin specified for the residuals.
col	Color of points.
pch	Plotting character.
cex	Plotting character size.
xR	Scaling the limits of the x axis. Ignored if xlim specified.
yR	Scaling the limits of the y axis. Ignored if ylim specified.
xlim	Limits for the x axis.
ylim	Limits for the y axis.
subset	A subset of the data to be used for the linear model.
parCustom	If TRUE, then the plotting margins are not modified automatically. This value should also be TRUE if the plots are being placed within a plot of multiple panels.
myHeight	A numerical vector of length 2 representing the ratio of the primary plot to the residual plot, in height.
plots	Not currently utilized.
highlight	Numerical vector specifying particular points to highlight.

hlCol	Color of highlighted points.
hlCex	Size of highlighted points.
hlPch	Plotting characters of highlighted points.
na.rm	Remove cases with NA values.
...	Additional arguments to plot.

```

---

loans_full_schema	<i>Loan data from Lending Club</i>
-------------------	------------------------------------

---

**Description**

This data set represents thousands of loans made through the Lending Club platform, which is a platform that allows individuals to lend to other individuals. Of course, not all loans are created equal. Someone who is essentially a sure bet to pay back a loan will have an easier time getting a loan with a low interest rate than someone who appears to be riskier. And for people who are very risky? They may not even get a loan offer, or they may not have accepted the loan offer due to a high interest rate. It is important to keep that last part in mind, since this data set only represents loans actually made, i.e. do not mistake this data for loan applications!

**Usage**

```
loans_full_schema
```

**Format**

A data frame with 10,000 observations on the following 55 variables.

**emp\_title** Job title.

**emp\_length** Number of years in the job, rounded down. If longer than 10 years, then this is represented by the value 10.

**state** Two-letter state code.

**home\_ownership** The ownership status of the applicant's residence.

**annual\_income** Annual income.

**verified\_income** Type of verification of the applicant's income.

**debt\_to\_income** Debt-to-income ratio.

**annual\_income\_joint** If this is a joint application, then the annual income of the two parties applying.

**verification\_income\_joint** Type of verification of the joint income.

**debt\_to\_income\_joint** Debt-to-income ratio for the two parties.

**delinq\_2y** Delinquencies on lines of credit in the last 2 years.

**months\_since\_last\_delinq** Months since the last delinquency.

**earliest\_credit\_line** Year of the applicant's earliest line of credit

**inquiries\_last\_12m** Inquiries into the applicant's credit during the last 12 months.

**total\_credit\_lines** Total number of credit lines in this applicant's credit history.

**open\_credit\_lines** Number of currently open lines of credit.

**total\_credit\_limit** Total available credit, e.g. if only credit cards, then the total of all the credit limits. This excludes a mortgage.

**total\_credit\_utilized** Total credit balance, excluding a mortgage.

**num\_collections\_last\_12m** Number of collections in the last 12 months. This excludes medical collections.

**num\_historical\_failed\_to\_pay** The number of derogatory public records, which roughly means the number of times the applicant failed to pay.

**months\_since\_90d\_late** Months since the last time the applicant was 90 days late on a payment.

**current\_accounts\_delinq** Number of accounts where the applicant is currently delinquent.

**total\_collection\_amount\_ever** The total amount that the applicant has had against them in collections.

**current\_installment\_accounts** Number of installment accounts, which are (roughly) accounts with a fixed payment amount and period. A typical example might be a 36-month car loan.

**accounts\_opened\_24m** Number of new lines of credit opened in the last 24 months.

**months\_since\_last\_credit\_inquiry** Number of months since the last credit inquiry on this applicant.

**num\_satisfactory\_accounts** Number of satisfactory accounts.

**num\_accounts\_120d\_past\_due** Number of current accounts that are 120 days past due.

**num\_accounts\_30d\_past\_due** Number of current accounts that are 30 days past due.

**num\_active\_debit\_accounts** Number of currently active bank cards.

**total\_debit\_limit** Total of all bank card limits.

**num\_total\_cc\_accounts** Total number of credit card accounts in the applicant's history.

**num\_open\_cc\_accounts** Total number of currently open credit card accounts.

**num\_cc\_carrying\_balance** Number of credit cards that are carrying a balance.

**num\_mort\_accounts** Number of mortgage accounts.

**account\_never\_delinq\_percent** Percent of all lines of credit where the applicant was never delinquent.

**tax\_liens** a numeric vector

**public\_record\_bankrupt** Number of bankruptcies listed in the public record for this applicant.

**loan\_purpose** The category for the purpose of the loan.

**application\_type** The type of application: either individual or joint.

**loan\_amount** The amount of the loan the applicant received.

**term** The number of months of the loan the applicant received.

**interest\_rate** Interest rate of the loan the applicant received.

**installment** Monthly payment for the loan the applicant received.

**grade** Grade associated with the loan.

**sub\_grade** Detailed grade associated with the loan.

**issue\_month** Month the loan was issued.

**loan\_status** Status of the loan.

**initial\_listing\_status** Initial listing status of the loan. (I think this has to do with whether the lender provided the entire loan or if the loan is across multiple lenders.)

**disbursement\_method** Disbursement method of the loan.

**balance** Current balance on the loan.

**paid\_total** Total that has been paid on the loan by the applicant.

**paid\_principal** The difference between the original loan amount and the current balance on the loan.

**paid\_interest** The amount of interest paid so far by the applicant.

**paid\_late\_fees** Late fees paid by the applicant.

### Source

This data comes from Lending Club (<https://www.lendingclub.com/info/statistics.action>), which provides a very large, open set of data on the people who received loans through their platform.

london_boroughs	<i>London Borough Boundaries</i>
-----------------	----------------------------------

---

### Description

This dataset contains the coordinates of the boundaries of all 32 boroughs of the Greater London area.

### Usage

london\_boroughs

### Format

A data frame with 45341 observations on the following 3 variables.

**borough** Name of the borough.

**x** The "easting" component of the coordinate, see details.

**y** The "northing" component of the coordinate, see details.

### Details

Map data was made available through the Ordnance Survey Open Data initiative. The data use the **National Grid** coordinate system, based upon eastings (x) and northings (y) instead of longitude and latitude.

The name variable covers all 32 boroughs in Greater London: Barking & Dagenham, Barnet, Bexley, Brent, Bromley, Camden, Croydon, Ealing, Enfield, Greenwich, Hackney, Hammersmith & Fulham, Haringey, Harrow, Havering, Hillingdon, Hounslow, Islington, Kensington & Chelsea, Kingston, Lambeth, Lewisham, Merton, Newham, Redbridge, Richmond, Southwark, Sutton, Tower Hamlets, Waltham Forest, Wandsworth, Westminster

### Source

<https://data.london.gov.uk/dataset/ordnance-survey-code-point>

Contains Ordnance Survey data released under the **Open Government License, OGL v2**.

### Examples

```
library(dplyr)
library(ggplot2)

# Calculate number of murders by borough
```

```

london_murders_counts <- london_murders %>%
  group_by(borough) %>%
  add_tally()

london_murders_counts

## Not run:
# Add number of murders to geographic boundary data
london_boroughs_murders <- inner_join(london_boroughs, london_murders_counts, by = "borough")

# Map murders
ggplot(london_boroughs_murders) +
  geom_polygon(aes(x = x, y = y, group = borough, fill = n), colour = "white") +
  scale_fill_distiller(direction = 1) +
  labs(x = "Easting", y = "Northing", fill = "Number of murders")

## End(Not run)

```

---

london_murders	<i>London Murders, 2006-2011</i>
----------------	----------------------------------

---

## Description

This dataset contains the victim name, age, and location of every murder recorded in the Greater London area by the Metropolitan Police from January 1, 2006 to September 7, 2011.

## Usage

```
london_murders
```

## Format

A data frame with 838 observations on the following 5 variables.

**forename** First name(s) of the victim.

**age** Age of the victim.

**date** Date of the murder (YYYY-MM-DD).

**year** Year of the murder.

**borough** The London borough in which the murder took place. See the Details section for a list of all the boroughs.

## Details

To visualize this data set using a map, see the [london\\_boroughs](#) dataset, which contains the latitude and longitude of polygons that define the boundaries of the 32 boroughs of Greater London.

The borough variable covers all 32 boroughs in Greater London: Barking & Dagenham, Barnet, Bexley, Brent, Bromley, Camden, Croydon, Ealing, Enfield, Greenwich, Hackney, Hammersmith & Fulham, Haringey, Harrow, Havering, Hillingdon, Hounslow, Islington, Kensington & Chelsea, Kingston, Lambeth, Lewisham, Merton, Newham, Redbridge, Richmond, Southwark, Sutton, Tower Hamlets, Waltham Forest, Wandsworth, Westminster

**Source**

<https://www.theguardian.com/news/datablog/2011/oct/05/murder-london-list#data>

**References**

Inspired by [The Guardian Datablog](#).

**Examples**

```
library(dplyr)
library(ggplot2)
library(lubridate)

london_murders %>%
  mutate(
    day_count = as.numeric(date - ymd("2006-01-01")),
    date_cut = cut(day_count, seq(0, 2160, 90))
  ) %>%
  group_by(date_cut) %>%
  add_tally() %>%
  ggplot(aes(x = date_cut, y = n)) +
  geom_col() +
  theme(axis.text.x = element_blank(), axis.ticks.x = element_blank()) +
  labs(x = "Date from 01/2006 - 09/2011", y = "Number of deaths per 90 days")
```

---

loop

*Output a message while inside a loop*

---

**Description**

NOTE: `utils::txtProgressBar()` and `utils::setTxtProgressBar()` are better. Output a message while inside a for loop to update the user on progress. This function is useful in tracking progress when the number of iterations is large or the procedures in each iteration take a long time.

**Usage**

```
loop(i, n = NULL, every = 1, extra = NULL)
```

**Arguments**

<code>i</code>	The index value used in the loop.
<code>n</code>	The last entry in the loop.
<code>every</code>	The number of loops between messages.
<code>extra</code>	Additional information to print.

**Author(s)**

David Diez

**See Also**[myPDF](#)**Examples**

```
for(i in 1:160){  
  loop(i, 160, 20, paste("iter", i))  
}
```

---

*lsegments**Create a Line Segment Plot*

---

**Description**

Creae a simple plot showing a line segment.

**Usage**

```
lsegments(  
  x = c(3, 7),  
  l = "o",  
  r = "c",  
  ticks = TRUE,  
  labs = 1,  
  add = 0,  
  ylim = c(-0.75, 0.25)  
)
```

**Arguments**

x	The endpoints of the interval. Values larger (smaller) than 999 (-999) will be interpreted as (negative) infinity.
l	Indicate whether the left end point should be open ("o") or closed ("c").
r	Indicate whether the right end point should be open ("o") or closed ("c").
ticks	Indicate whether to show tick marks (TRUE) or not (FALSE).
labs	The position for the point labels. Set to 0 if no labels should be shown.
add	Indicate whether the line segment should be added to an existing plot (TRUE) or a new plot should be created (FALSE).
ylim	A vector of length 2 specifying the vertical plotting limits, which may be useful for fine-tuning plots. The default is c(-0.75, 0.25).

**Author(s)**

David Diez

**See Also**[dlsegments](#), [CCP](#), [ArrowLines](#)**Examples**

```
lsegments(c(2,7), "o", "c", ylim=c(-0.3, 0.2))
```

```
lsegments(c(5,7), "c", "c", ylim=c(-0.3, 0.2))
```

```
lsegments(c(4,1000), "o", "o", ylim=c(-0.3, 0.2))
```

---

`mail_me`*Influence of a Good Mood on Helpfulness*

---

**Description**

This study investigated whether finding a coin influenced a person's likelihood of mailing a sealed but addressed letter that appeared to have been accidentally left in a conspicuous place. Several variables were collected during the experiment, including two randomized variables of whether there was a coin to be found and whether the letter already had a stamp on it.

**Usage**`mail_me`**Format**

A data frame with 42 observations on the following 4 variables.

**stamped** a factor with levels no yes

**found\_coin** a factor with levels coin no\_coin

**gender** a factor with levels female male

**mailed\_letter** a factor with levels no yes

**Details**

The precise context was in a phone booth (this study is from the 1970s!), where a person who entered a phone booth would find a dime in the phone tray, which would be sufficient to pay for their phone call. There was also a letter next to the phone, which sometimes had a stamp on it.

**Source**

Levin PF, Isen AM. 1975. Studies on the Effect of Feeling Good on Helping. *Sociometry* 31(1), p141-147.

**Examples**

```
table(mail_me)
(x <- table(mail_me[, c("mailed_letter", "found_coin")]))
chisq.test(x)

(x <- table(mail_me[, c("mailed_letter", "stamped")]))
chisq.test(x)

m <- glm(mailed_letter ~ stamped + found_coin + gender,
        data = mail_me,
        family = binomial)
summary(m)
```

---

major\_survey

*Survey of Duke students and the area of their major*

---

**Description**

Survey of 218 students, collecting information on their GPAs and their academic major.

**Usage**

```
major_survey
```

**Format**

A data frame with 218 observations on the following 2 variables.

**gpa** Grade point average (GPA).

**major** Area of academic major.

**Examples**

```
library(ggplot2)

ggplot(major_survey, aes(x = major, y = gpa)) +
  geom_boxplot()
```

---

 makeTube

*Regression tube*

---

### Description

Produce a linear, quadratic, or nonparametric tube for regression data.

### Usage

```
makeTube(
  x,
  y,
  Z = 2,
  R = 1,
  col = "#00000022",
  border = "#00000000",
  type = c("lin", "quad", "robust"),
  stDev = c("constant", "linear", "other"),
  length.out = 99,
  bw = "default",
  plotTube = TRUE,
  addLine = TRUE,
  ...
)
```

### Arguments

x	x coordinates.
y	y coordinates.
Z	Number of standard deviations out from the regression line to extend the tube.
R	Control of how far the tube extends to the left and right.
col	Fill color of the tube.
border	Border color of the tube.
type	The type of model fit to the data. Here 'robust' results in a nonparametric estimate.
stDev	Choices are constant variance ('constant'), the standard deviation of the errors changes linearly ('linear'), or the standard deviation of the errors should be estimated using nonparametric methods ('other').
length.out	The number of observations used to build the regression model. This argument may be increased to increase the smoothing of a quadratic or nonparametric curve.
bw	Bandwidth used if type='robust' or homosk=FALSE.
plotTube	Whether the tube should be plotted.
addLine	Whether the linear model should be plotted.
...	Additional arguments passed to the lines function if addLine=TRUE.

**Value**

X	x coordinates for the regression model.
Y	y coordinates for the regression model.
tubeX	x coordinates for the boundary of the tube.
tubeY	y coordinates for the boundary of the tube.

**Author(s)**

David Diez

---

malaria

*Malaria Vaccine Trial*

---

### Description

Volunteer patients were randomized into one of two experiment groups where they would receive an experimental vaccine or a placebo. They were subsequently exposed to a drug-sensitive strain of malaria and observed to see whether they came down with an infection.

### Usage

malaria

### Format

A data frame with 20 observations on the following 2 variables.

**treatment** Whether a person was given the experimental ‘vaccine’ or a ‘placebo’.

**outcome** Whether the person got an ‘infection’ or ‘no infection’.

### Details

In this study, volunteer patients were randomized into one of two experiment groups: 14 patients received an experimental vaccine or 6 patients received a placebo vaccine. Nineteen weeks later, all 20 patients were exposed to a drug-sensitive malaria virus strain; the motivation of using a drug-sensitive strain of virus here is for ethical considerations, allowing any infections to be treated effectively.

### Source

```
data(male_heights_fcid)
histPlot(male_heights_fcid$height_inch)
```

---

mammals

*Sleep in Mammals*

---

**Description**

This data set includes data for 39 species of mammals distributed over 13 orders. The data were used for analyzing the relationship between constitutional and ecological factors and sleeping in mammals. Two qualitatively different sleep variables (dreaming and non dreaming) were recorded. Constitutional variables such as life span, body weight, brain weight and gestation time were evaluated. Ecological variables such as severity of predation, safety of sleeping place and overall danger were inferred from field observations in the literature.

**Usage**

```
mammals
```

**Format**

A data frame with 62 observations on the following 11 variables.

**species** Species of mammals

**body\_wt** Total body weight of the mammal (in kg)

**brain\_wt** Brain weight of the mammal (in kg)

**non\_dreaming** Number of hours of non dreaming sleep

**dreaming** Number of hours of dreaming sleep

**total\_sleep** Total number of hours of sleep

**life\_span** Life span (in years)

**gestation** Gestation time (in days)

**predation** An index of how likely the mammal is to be preyed upon. 1 = least likely to be preyed upon. 5 = most likely to be preyed upon.

**exposure** An index of the how exposed the mammal is during sleep. 1 = least exposed (e.g., sleeps in a well-protected den). 5 = most exposed.

**danger** An index of how much danger the mammal faces from other animals. This index is based upon Predation and Exposure. 1 = least danger from other animals. 5 = most danger from other animals.

**Source**

---

mariokart	<i>Wii Mario Kart auctions from Ebay</i>
-----------	--

---

**Description**

Auction data from Ebay for the game Mario Kart for the Nintendo Wii. This data was collected in early October 2009.

**Usage**

mariokart

**Format**

A data frame with 143 observations on the following 12 variables. All prices are in US dollars.

**id** Auction ID assigned by Ebay.

**duration** Auction length, in days.

**n\_bids** Number of bids.

**cond** Game condition, either new or used.

**start\_pr** Start price of the auction.

**ship\_pr** Shipping price.

**total\_pr** Total price, which equals the auction price plus the shipping price.

**ship\_sp** Shipping speed or method.

**seller\_rate** The seller's rating on Ebay. This is the number of positive ratings minus the number of negative ratings for the seller.

**stock\_photo** Whether the auction feature photo was a stock photo or not. If the picture was used in many auctions, then it was called a stock photo.

**wheels** Number of Wii wheels included in the auction. These are steering wheel attachments to make it seem as though you are actually driving in the game. When used with the controller, turning the wheel actually causes the character on screen to turn.

**title** The title of the auctions.

**Details**

There are several interesting features in the data. First off, note that there are two outliers in the data. These serve as a nice example of what one should do when encountering an outlier: examine the data point and remove it only if there is a good reason. In these two cases, we can see from the auction titles that they included other items in their auctions besides the game, which justifies removing them from the data set.

This data set includes all auctions for a full week in October 2009. Auctions were included in the data set if they satisfied a number of conditions. (1) They were included in a search for "wii mario kart" on ebay.com, (2) items were in the Video Games > Games > Nintendo Wii section of Ebay, (3) the listing was an auction and not exclusively a "Buy it Now" listing (sellers sometimes offer an optional higher price for a buyer to end bidding and win the auction immediately, which is an *optional* Buy it Now auction), (4) the item listed was the actual game, (5) the item was being sold from the US, (6) the item had at least one bidder, (7) there were no other items included in the auction with the exception of racing wheels, either generic or brand-name being acceptable, and (8) the auction did not end with a Buy It Now option.

midterms_house	<i>President's party performance and unemployment rate</i>
----------------	--

---

**Description**

Covers midterm elections.

**Usage**

```
midterms_house
```

**Format**

A data frame with 29 observations on the following 5 variables.

**year** a numeric vector

**potus** The president in office.

**party** President's party.

**unemp** Unemployment rate.

**house\_change** Change in House seats for the president's party.

**Details**

An older version of this data is at [unemploy\\_pres](#).

**Source**

Wikipedia.

**Examples**

```
library(ggplot2)

ggplot(midterms_house, aes(x = unemp, y = house_change)) +
  geom_point()
```

---

migraine

*Migraines and acupuncture*

---

**Description**

Experiment involving acupuncture and sham acupuncture (as placebo) in the treatment of migraines.

**Usage**

migraine

**Format**

A data frame with 89 observations on the following 2 variables.

**group** a factor with levels control treatment

**pain\_free** a factor with levels no yes

**Source**

G. Allais et al. Ear acupuncture in the treatment of migraine attacks: a randomized trial on the efficacy of appropriate versus inappropriate acupoints. In: *Neurological Sci.* 32.1 (2011), pp. 173-175.

**Examples**

migraine

---

military

*US Military Demographics*

---

**Description**

This dataset contains demographic information on every member of the US armed forces including gender, race, and rank.

**Usage**

military

**Format**

A data frame with 1,414,593 observations on the following 6 variables.

**grade** The status of the service member as enlisted officer or warrant officer.

**branch** The branch of the armed forces: air force, army, marine corps, navy.

**gender** Whether the service member is female or male.

**race** The race identified by the service member: ami/aln (american indian/alaskan native), asian, black, multi (multi-ethnic), p/i (pacific islander), unk (unknown), or white.

**hispanic** Whether a service member identifies with being hispanic (TRUE) or not (FALSE).

**rank** The numeric rank of the service member (higher number indicates higher rank).

**Details**

The branches covered by this data set include the Army, Navy, Air Force, and Marine Corps. Demographic information on the Coast Guard is contained in the original data set but has not been included here.

**Source**

Data provided by the Department of Defense and made available at <https://catalog.data.gov/dataset/personnel-trends-by-gender-race>, retrieved 2012-02-20.

**Examples**

```

mlbbat10

*Major League Baseball Player Hitting Statistics for 2010*

---

### Description

Major League Baseball Player Hitting Statistics for 2010.

### Usage

mlbbat10

### Format

A data frame with 1199 observations on the following 19 variables.

**name** Player name

**team** Team abbreviation

**position** Player position

**game** Number of games

**at\_bat** Number of at bats

**run** Number of runs

**hit** Number of hits

**double** Number of doubles

**triple** Number of triples

**home\_run** Number of home runs

**rbi** Number of runs batted in

**total\_base** Total bases, computed as  $3*HR + 2*3B + 1*2B + H$

**walk** Number of walks

**strike\_out** Number of strikeouts

**stolen\_base** Number of stolen bases

**caught\_stealing** Number of times caught stealing

**obp** On base percentage

**slg** Slugging percentage ( $total\_base / at\_bat$ )

**bat\_avg** Batting average

mlb\_players\_18

*Batter Statistics for 2018 Major League Baseball (MLB) Season*

---

### Description

Batter statistics for 2018 Major League Baseball season.

### Usage

```
mlb_players_18
```

### Format

A data frame with 1270 observations on the following 19 variables.

**name** Player name

**team** Team abbreviation

**position** Position abbreviation: 1B = first base, 2B = second base, 3B = third base, C = catcher, CF = center field (outfield), DH = designated hitter, LF = left field (outfield), P = pitcher, RF = right field (outfield), SS = shortstop.

**games** Number of games played.

**AB** At bats.

**R** Runs.

**H** Hits.

**doubles** Doubles.

**triples** Triples.

**HR** Home runs.

**RBI** Runs batted in.

**walks** Walks.

**strike\_outs** Strike outs.

**stolen\_bases** Stolen bases.

**caught\_stealing\_base** Number of times caught stealing a base.

**AVG** Batting average.

**OBP** On-base percentage.

**SLG** Slugging percentage.

**OPS** On-base percentage plus slugging percentage.

MosaicPlot

*Custom Mosaic Plot*

---

**Description**

Plot a mosaic plot custom built for a particular figure.

**Usage**

```
MosaicPlot(  
  formula,  
  data,  
  col = "#00000022",  
  border = 1,  
  dir = c("v", "h"),  
  off = 0.01,  
  cex.axis = 0.7,  
  col.dir = "v",  
  flip = c("v"),  
  ...  
)
```

**Arguments**

formula	Formula describing the variable relationship.
data	Data frame for the variables, optional.
col	Colors for plotting.
border	Ignored.
dir	Ignored.
off	Fraction of white space between each box in the plot.
cex.axis	Axis label size.
col.dir	Direction to lay out colors.
flip	Whether to flip the ordering of the vertical ("v") and/or horizontal ("h") ordering in the plot.
...	Ignored.

**Author(s)**

David Diez

**Examples**

```
data(email)  
data(COL)  
email$spam <- ifelse(email$spam == 0, "not\nspam", "spam")  
par(las = 1)  
MosaicPlot(number ~ spam, email, col = COL[1:3], off = 0.02)
```

---

mtl *Medial temporal lobe (MTL) and other data for 26 participants*

---

### Description

The data are from a convenience sample of 25 women and 10 men who were middle-aged or older. The purpose of the study was to understand the relationship between sedentary behavior and thickness of the medial temporal lobe (MTL) in the brain.

### Usage

mtl

### Format

A data frame with 35 observations on the following 23 variables.

**subject** ID for the individual.

**sex** Gender, which takes values F (female) or M (male).

**ethnic** Ethnicity, simplified to Caucasian and Other.

**educ** Years of educational.

**e4grp** APOE-4 status, taking a value of E4 or Non-E4.

**age** Age, in years.

**mmse** Score from the Mini-Mental State Examination, which is a global cognition evaluation.

**ham\_a** Score on the Hamilton Rating Scale for anxiety.

**ham\_d** Score on the Hamilton Rating Scale for depression.

**dig\_sym** We (the authors of this R package) are unsure as to the meaning of this variable.

**delay\_vp** We (the authors of this R package) are unsure as to the meaning of this variable.

**bfr\_selective\_reminding\_delayed** We (the authors of this R package) are unsure as to the meaning of this variable.

**sitting** Self-reported time sitting per day, averaged to the nearest hour.

**met\_minwk** Metabolic equivalent units score (activity level). A score of 0 means “no activity” while 3000 is considered “high activity”.

**ipa\_qgrp** Classification of METminwk into Low or High.

**aca1** Thickness of the CA1 subregion of the MTL.

**aca23dg** Thickness of the CA23DG subregion of the MTL.

**ae\_cort** Thickness of a subregion of the MTL.

**a\_fusi\_cort** Thickness of the fusiform gyrus subregion of the MTL.

**a\_ph\_cort** Thickness of the perirhinal cortex subregion of the MTL.

**a\_pe\_cort** Thickness of the entorhinal cortex subregion of the MTL.

**asubic** Thickness of the subiculum subregion of the MTL.

**total** Total MTL thickness.

---

murders

*Data for 20 metropolitan areas.*

---

## Description

Population, percent in poverty, percent unemployment, and murder rate.

## Usage

murders

## Format

A data frame with 20 metropolitan areas on the following 4 variables.

**population** Population.

**perc\_pov** Percent in poverty.

**perc\_unemp** Percent unemployed.

**annual\_murders\_per\_mil** Number of murders per year per million people.

**Examples**

```
library(ggplot2)

ggplot(murders, aes(x = perc_pov, y = annual_murders_per_mil)) +
  geom_point() +
  labs(
    x = "Percent in poverty",
    y = "Number of murders per year per million people"
  )
```

myPDF

*Custom PDF function***Description**

A similar function to pdf and png, except that different defaults are provided, including for the plotting parameters.

**Usage**

```
myPDF(
  fileName,
  width = 5,
  height = 3,
  mar = c(3.9, 3.9, 1, 1),
  mgp = c(2.8, 0.55, 0),
  las = 1,
  tcl = -0.3,
  ...
)
```

**Arguments**

fileName	File name for the image to be output. The name should end in .pdf.
width	The width of the image file (inches). Default: 5.
height	The height of the image file (inches). Default: 3.
mar	Plotting margins. To change, input a numerical vector of length 4.
mgp	Margin graphing parameters. To change, input a numerical vector of length 3. The first argument specifies where x and y labels are placed; the second specifies the axis labels are placed; and the third specifies how far to pull the entire axis from the plot.
las	Orientation of axis labels. Input 0 for the default.
tcl	The tick mark length as a proportion of text height. The default is -0.5.
...	Additional arguments to par.

**Author(s)**

David Diez

**See Also**[edaPlot](#)**Examples**

# dev.off()
```

---

`nba_heights`*NBA Player heights from 2008-9*

---

**Description**

Heights of all NBA players from the 2008-9 season.

**Usage**`nba_heights`**Format**

A data frame with 435 observations (players) on the following 4 variables.

**last\_name** Last name.**first\_name** First name.**h\_meters** Height, in meters.**h\_in** Height, in inches.**Source**Collected from <http://www.nba.com>.**Examples**

```
qqnorm(nba_heights$h_meters)
```

---

`nba_players_19`*NBA Players for the 2018-2019 season*

---

**Description**

Summary information from the NBA players for the 2018-2019 season.

**Usage**`nba_players_19`**Format**

A data frame with 494 observations on the following 7 variables.

**first\_name** First name.

**last\_name** Last name.

**team** Team name

**team\_abbr** 3-letter team abbreviation.

**position** Player position.

**number** Jersey number.

**height** Height, in inches.

**Source**

<https://www.nba.com/players>

**Examples**

```
hist(nba_players_19$height, 20)
table(nba_players_19$team)
```

---

`ncbirths`*North Carolina births*

---

**Description**

In 2004, the state of North Carolina released to the public a large data set containing information on births recorded in this state. This data set has been of interest to medical researchers who are studying the relation between habits and practices of expectant mothers and the birth of their children. This is a random sample of 1,000 cases from this data set.

**Usage**

ncbirths

**Format**

A data frame with 1000 observations on the following 13 variables.

**fage** Father's age in years.

**mage** Mother's age in years.

**mature** Maturity status of mother.

**weeks** Length of pregnancy in weeks.

**premie** Whether the birth was classified as premature (premie) or full-term.

**visits** Number of hospital visits during pregnancy.

**gained** Weight gained by mother during pregnancy in pounds.

**weight** Weight of the baby at birth in pounds.

**lowbirthweight** Whether baby was classified as low birthweight (low) or not (not low).

**gender** Gender of the baby, female or male.

**habit** Status of the mother as a nonsmoker or a smoker.

**marital** Whether mother is married or not married at birth.

**whitemom** Whether mom is white or not white.

**Examples**

```
library(ggplot2)

ggplot(ncbirths, aes(x = habit, y = weight)) +
  geom_boxplot() +
  labs(x = "Smoking status of mother", y = "Birth weight of baby (in lbs)")

ggplot(ncbirths, aes(x = whitemom, y = visits)) +
  geom_boxplot() +
  labs(x = "Mother's race", y = "Number of doctor visits during pregnancy")

ggplot(ncbirths, aes(x = mature, y = gained)) +
  geom_boxplot() +
  labs(x = "Mother's age category", y = "Weight gained during pregnancy")
```

---

normTail                      *Normal distribution tails*

---

**Description**

Produce a normal (or t) distribution and shaded tail.

**Usage**

```
normTail(  
  m = 0,  
  s = 1,  
  L = NULL,  
  U = NULL,  
  M = NULL,  
  df = 1000,  
  curveColor = 1,  
  border = 1,  
  col = "#CCCCCC",  
  xlim = NULL,  
  ylim = NULL,  
  xlab = "",  
  ylab = "",  
  digits = 2,  
  axes = 1,  
  detail = 999,  
  xLab = c("number", "symbol"),  
  cex.axis = 1,  
  xAxisIncr = 1,  
  add = FALSE,  
  ...  
)
```

**Arguments**

m	Numerical value for the distribution mean.
s	Numerical value for the distribution standard deviation.
L	Numerical value representing the cutoff for a shaded lower tail.
U	Numerical value representing the cutoff for a shaded upper tail.
M	Numerical value representing the cutoff for a shaded central region.
df	Numerical value describing the degrees of freedom. Default is 1000, which results in a nearly normal distribution. Small values may be useful to emphasize small tails.
curveColor	The color for the distribution curve.
border	The color for the border of the shaded area.

col	The color for filling the shaded area.
xlim	Limits for the x axis.
ylim	Limits for the y axis.
xlab	A title for the x axis.
ylab	A title for the y axis.
digits	The maximum number of digits past the decimal to use in axes values.
axes	A numeric value denoting whether to draw both axes (3), only the vertical axes (2), only the horizontal axes (1, the default), or no axes (0).
detail	A number describing the number of points to use in drawing the normal curve. Smaller values correspond to a less smooth curve but reduced memory usage in the final file.
xLab	If "number", then the axis is drawn at the mean, and every standard deviation out until the third standard deviation. If "symbol", then Greek letters are used for standard deviations from three standard deviations from the mean.
cex.axis	Numerical value controlling the size of the axis labels.
xAxisIncr	A number describing how often axis labels are placed, scaled by standard deviations. This argument is ignored if xLab = "symbol".
add	Boolean indicating whether to add this normal curve to the existing plot.
...	Additional arguments to plot.

**Author(s)**

David Diez

**See Also**[buildAxis](#)**Examples**

         xLab = 'symbol', cex.axis = 0.8, xAxisIncr = 2)

```

---

nuclear_survey	<i>Nuclear Arms Reduction Survey</i>
----------------	--------------------------------------

---

**Description**

A simple random sample of 1,028 US adults in March 2013 found that 56% support nuclear arms reduction.

**Usage**

```
nuclear_survey
```

**Format**

A data frame with 1028 observations on the following variable.

**arms\_reduction** Responses of favor or against.

**Source**

Gallup report: In U.S., 56 percent Favor U.S.-Russian Nuclear Arms Reductions. Available at <https://news.gallup.com/poll/161198/favor-russian-nuclear-arms-reductions.aspx>.

**Examples**

```
table(nuclear_survey)
```

---

nycflights	<i>Flights data</i>
------------	---------------------

---

**Description**

On-time data for a random sample of flights that departed NYC (i.e. JFK, LGA or EWR) in 2013.

**Usage**

```
nycflights
```

**Format**

A `tbl_df` with 32,735 rows and 16 variables:

**year,month,day** Date of departure.

**dep\_time,arr\_time** Departure and arrival times, local tz.

**dep\_delay,arr\_delay** Departure and arrival delays, in minutes. Negative times represent early departures/arrivals.

**hour,minute** Time of departure broken in to hour and minutes.

**carrier** Two letter carrier abbreviation. See ‘airlines’ in the ‘nycflights13’ package for more information or google the airline code.

**tailnum** Plane tail number.

**flight** Flight number.

**origin,dest** Origin and destination. See ‘airports’ in the ‘nycflights13’ package for more information or google airport the code.

**air\_time** Amount of time spent in the air.

**distance** Distance flown.

**Source**

offshore\_drilling      *California poll on drilling off the California coast*

---

**Description**

A 2010 survey asking a randomly sample of registered voters in California for their position on drilling for oil and natural gas off the Coast of California.

**Usage**

```
offshore_drilling
```

**Format**

A data frame with 827 observations on the following 2 variables.

**position** a factor with levels do not know oppose support

**college\_grad** a factor with levels no yes

**Source**

Survey USA, Election Poll #16804, data collected July 8-11, 2010.

**Examples**

offshore\_drilling

---

orings

*1986 Challenger disaster and O-rings*

---

**Description**

On January 28, 1986, a routine launch was anticipated for the Challenger space shuttle. Seventy-three seconds into the flight, disaster happened: the shuttle broke apart, killing all seven crew members on board. An investigation into the cause of the disaster focused on a critical seal called an O-ring, and it is believed that damage to these O-rings during a shuttle launch may be related to the ambient temperature during the launch. The table below summarizes observational data on O-rings for 23 shuttle missions, where the mission order is based on the temperature at the time of the launch.

**Usage**

orings

**Format**

A data frame with 23 observations on the following 2 variables.

**temp** Temperature, in Fahrenheit.

**damage** Number of damaged O-rings (out of 6).

**Source**

<https://archive.ics.uci.edu/ml/datasets/Challenger+USA+Space+Shuttle+O-Ring>

**Examples**

orings

---

oscars

*Oscar winners, 1929 to 2018*

---

## Description

Best actor and actress Oscar winners from 1929 to 2018

## Usage

oscars

## Format

A data frame with 182 observations on the following 10 variables.

**oscar\_no** Oscar ceremony number.

**oscar\_yr** Year the Oscar ceremony was held.

**award** Best actress or Best actor.

**name** Name of winning actor or actress.

**movie** Name of movie actor or actress got the Oscar for.

**age** Age at which the actor or actress won the Oscar.

**birth\_pl** US State where the actor or actress was born, country if foreign.

**birth\_date** Birth date of actor or actress.

**birth\_mo** Birth month of actor or actress.

**birth\_d** Birth day of actor or actress.

**birth\_y** Birth year of actor or actress.

## Details

Although there have been only 84 Oscar ceremonies until 2012, there are 85 male winners and 85 female winners because ties happened on two occasions (1933 for the best actor and 1969 for the best actress).

## Source

Journal of Statistical Education, <http://jse.amstat.org/datasets/oscars.dat.txt>, updated through 2019 using information from Oscars.org and Wikipedia.org.

## Examples

```
library(ggplot2)
library(dplyr)

ggplot(oscars, aes(x = award, y = age)) +
  geom_boxplot()

ggplot(oscars, aes(x = factor(birth_mo))) +
  geom_bar()

oscars %>%
  count(birth_pl, sort = TRUE)
```

---

outliers

*Simulated data sets for different types of outliers*

---

## Description

Data sets for showing different types of outliers

## Usage

```
outliers
```

## Format

A data frame with 50 observations on the following 5 variables.

**x** a numeric vector

**y** a numeric vector

**x\_inf** a numeric vector

**y\_lev** a numeric vector

**y\_out** a numeric vector

## Examples

```
outliers
```

---

penelope

*Guesses at the weight of Penelope (a cow)*

---

### Description

The data was collected by the Planet Money podcast to test a theory about crowd-sourcing. Penelope's actual weight was 1,355 pounds.

### Usage

```
penelope
```

### Format

A data frame with 17,184 observations on the following variable.

**weight** Guesses of Penelope's weight, in pounds.

### Source

<https://www.npr.org/sections/money/2015/08/07/429720443/17-205-people-guessed-the-weight-of-a-cow-1>

### Examples

```
library(ggplot2)

ggplot(penelope, aes(x = weight)) +
  geom_histogram(binwidth = 250)

summary(penelope$weight)
```

---

penetrating\_oil

*What's the best way to loosen a rusty bolt?*

---

### Description

The channel Project Farm on YouTube investigated penetrating oils and other options for loosening rusty bolts. Eight options were evaluated, including a control group, to determine which was most effective.

### Usage

```
penetrating_oil
```

**Format**

A data frame with 30 observations on the following 2 variables.

**treatment** The different treatments tried: none (control), Heat (via blow torch), Acetone/ATF, AeroKroil, Liquid Wrench, PB Blaster, Royal Purple, and WD-40.

**torque** Torque required to loosen the rusty bolt, which was measured in foot-pounds.

**Source**

<https://www.youtube.com/watch?v=xUEob2oAKVs>

**Examples**

```
m <- lm(torque ~ treatment, data = penetrating_oil)
anova(m)

# There are 28 pairwise comparisons to be made.
xbar <- tapply(penetrating_oil$torque, penetrating_oil$treatment, mean)
n <- tapply(penetrating_oil$torque, penetrating_oil$treatment, length)
s <- summary(m)$sigma
df <- summary(m)$df[1]

diff <- c()
se <- c()
k <- 0
N <- length(n)
K <- N * (N - 1) / 2
for (i in 1:(N - 1)) {
  for (j in (i + 1):N) {
    k <- k + 1
    diff[k] <- xbar[i] - xbar[j]
    se[k] <- s * sqrt(1 / n[i] + 1 / n[j])
    if (2 * K * pt(-abs(diff[k] / se[k]), df) < 0.05) {
      cat("0.05 - ", names(n)[c(i, j)], "\n")
    } else if (2 * K * pt(-abs(diff[k] / se[k]), df) < 0.1) {
      cat("0.1 - ", names(n)[c(i, j)], "\n")
    } else if (2 * K * pt(-abs(diff[k] / se[k]), df) < 0.2) {
      cat("0.2 - ", names(n)[c(i, j)], "\n")
    } else if (2 * K * pt(-abs(diff[k] / se[k]), df) < 0.3) {
      cat("0.3 - ", names(n)[c(i, j)], "\n")
    }
  }
}

# Smallest p-value using Bonferroni
min(2 * K * pt(-abs(diff / se), df))

# Better pairwise comparison method.
anova(m1 <- aov(torque ~ treatment, data = penetrating_oil))
TukeyHSD(m1)
```

---

penny\_ages

*Penny Ages*

---

**Description**

Sample of pennies and their ages. Taken in 2004.

**Usage**

penny\_ages

**Format**

A data frame with 648 observations on the following 2 variables.

**year** Penny's year.

**age** Age as of 2004.

**Examples**

```
hist(penny_ages$year)
```

---

pew\_energy\_2018

*Pew Survey on Energy Sources in 2018*

---

**Description**

US-based survey on support for expanding six different sources of energy, including solar, wind, offshore drilling, hydrolic fracturing ("fracking"), coal, and nuclear.

**Usage**

pew\_energy\_2018

**Format**

The format is: List of 6 \$ solar\_panel\_farms : List of responses on solar farms. \$ wind\_turbine\_farms : List of responses on wind turbine farms. \$ offshore\_drilling : List of responses on offshore drilling. \$ hydrolic\_fracturing : List of responses on hydrolic fracturing. \$ coal\_mining : List of responses on coal mining. \$ nuclear\_power\_plants: List of responses on nuclear.

### Details

We did not have access to individual responses in original data set, so we took the published percentages and backed out the breakdown

### Source

Prop <- function(x) { table(x) / length(x) }
lapply(pew_energy_2018, Prop)
```

---

photo\_classify

*Photo classifications: fashion or not*

---

### Description

This is a simulated data set for photo classifications based on a machine learning algorithm versus what the true classification is for those photos. While the data are not real, they resemble performance that would be reasonable to expect in a well-built classifier.

### Usage

```
photo_classify
```

### Format

A data frame with 1822 observations on the following 2 variables.

**mach\_learn** The prediction by the machine learning system as to whether the photo is about fashion or not.

**truth** The actual classification of the photo by a team of humans.

### Details

The hypothetical ML algorithm has a precision of 90%, meaning of those photos it claims are fashion, about 90% of them are actually about fashion. The recall of the ML algorithm is about 64%, meaning of the photos that are about fashion, it correctly predicts that they are about fashion about 64% of the time.

**Source**

The data are simulated / hypothetical.

**Examples**

```
data(photo_classify)
table(photo_classify)
```

---

piracy

*Piracy and PIPA/SOPA*

---

**Description**

This data set contains observations on all 100 US Senators and 434 of the 325 US Congressional Representatives related to their support of anti-piracy legislation that was introduced at the end of 2011.

**Usage**

```
piracy
```

**Format**

A data frame with 534 observations on the following 8 variables.

**name** Name of legislator.

**party** Party affiliation as democrat (D), Republican (R), or Independent (I).

**state** Two letter state abbreviation.

**money\_pro** Amount of money in dollars contributed to the legislator's campaign in 2010 by groups generally thought to be supportive of PIPA/SOPA: movie and TV studios, record labels.

**money\_con** Amount of money in dollars contributed to the legislator's campaign in 2010 by groups generally thought to be opposed to PIPA/SOPA: computer and internet companies.

**years** Number of years of service in Congress.

**stance** Degree of support for PIPA/SOPA with levels Leaning No, No, Undecided, Unknown, Yes

**chamber** Whether the legislator is a member of either the house or senate.

**Details**

The Stop Online Piracy Act (SOPA) and the Protect Intellectual Property Act (PIPA) were two bills introduced in the US House of Representatives and the US Senate, respectively, to curtail copyright infringement. The bill was controversial because there were concerns the bill limited free speech rights. ProPublica, the independent and non-profit news organization, compiled this data set to compare the stance of legislators towards the bills with the amount of campaign funds that they received from groups considered to be supportive of or in opposition to the legislation.

For more background on the legislation and the formulation of `money_pro` and `money_con`, read the documentation on ProPublica, linked below.

**Source**

<https://projects.propublica.org/sopa> The list may be slightly out of date since many politician's perspectives on the legislation were in flux at the time of data collection.

**Examples**

```
library(dplyr)
library(ggplot2)

pipa <- filter(piracy, chamber == "senate")

pipa %>%
  group_by(stance) %>%
  summarise(money_pro_mean = mean(money_pro, na.rm = TRUE)) %>%
  ggplot(aes(x = stance, y = money_pro_mean)) +
  geom_col() +
  labs(x = "Stance", y = "Average contribution, in $",
       title = "Average contribution to the legislator's campaign in 2010",
       subtitle = "by groups supportive of PIPA/SOPA (movie and TV studios, record labels)")

ggplot(pipa, aes(x = stance, y = money_pro)) +
  geom_boxplot() +
  labs(x = "Stance", y = "Contribution, in $",
       title = "Contribution by groups supportive of PIPA/SOPA",
       subtitle = "Movie and TV studios, record labels")

ggplot(pipa, aes(x = stance, y = money_con)) +
  geom_boxplot() +
  labs(x = "Stance", y = "Contribution, in $",
       title = "Contribution by groups opposed to PIPA/SOPA",
       subtitle = "Computer and internet companies")

pipa %>%
  filter(
    money_pro > 0,
    money_con > 0
  ) %>%
  mutate(for_pipa = ifelse(stance == "yes", "yes", "no")) %>%
  ggplot(aes(x = money_pro, y = money_con, color = for_pipa)) +
  geom_point() +
  scale_color_manual(values = c("gray", "red")) +
  scale_y_log10() +
  scale_x_log10() +
  labs(x = "Contribution by pro-PIPA groups",
       y = "Contribution by anti-PIPA groups",
       color = "For PIPA")
```

---

playing\_cards

*Table of Playing Cards in 52-Card Deck*

---

### Description

A table describing each of the 52 cards in a deck.

### Usage

```
playing_cards
```

### Format

A data frame with 52 observations on the following 2 variables.

**number** The number or card type.

**suit** Card suit, which takes one of four values: Club, Diamond, Heart, or Spade.

**face\_card** Whether the card counts as a face card.

### Source

This extremely complex data set was generated from scratch.

### Examples

```
playing_cards <- data.frame(  
  number = rep(c(2:10, "J", "Q", "K", "A"), 4),  
  suit = rep(c("Spade", "Diamond", "Club", "Heart"), rep(13, 4))  
)  
playing_cards$face_card <-  
  ifelse(playing_cards$number %in% c(2:10, "A"), "no", "yes")
```

---

PlotWLine

*Plot data and add a regression line*

---

### Description

Plot data and add a regression line.

**Usage**

```
PlotWLine(  
  x,  
  y,  
  xlab = "",  
  ylab = "",  
  col = fadeColor(4, "88"),  
  cex = 1.2,  
  pch = 20,  
  n = 4,  
  nMax = 4,  
  yR = 0.1,  
  axes = TRUE,  
  ...  
)
```

**Arguments**

x	Predictor variable.
y	Outcome variable.
xlab	x-axis label.
ylab	y-axis label.
col	Color of points.
cex	Size of points.
pch	Plotting character.
n	The preferred number of axis labels.
nMax	The maximum number of axis labels.
yR	y-limit buffer factor.
axes	Boolean to indicate whether or not to include axes.
...	Passed to plot.

**See Also**

```

---

pm25\_2011\_durham      *Air quality for Durham, NC*

---

### Description

Daily air quality is measured by the air quality index (AQI) reported by the Environmental Protection Agency.

### Usage

pm25\_2011\_durham

### Format

A data frame with 449 observations on the following 20 variables.

**date** Date

**aqs\_site\_id** a factor with levels 37-063-0015

**poc** a numeric vector

**daily\_mean\_pm2\_5\_concentration** a numeric vector

**units** a factor with levels ug/m3 LC

**daily\_aqi\_value** a numeric vector

**daily\_obs\_count** a numeric vector

**percent\_complete** a numeric vector

**aqs\_parameter\_code** a numeric vector

**aqs\_parameter\_desc** a factor with levels Acceptable PM2.5 AQI & Speciation Mass PM2.5 -Local Conditions

**csa\_code** a numeric vector

**csa\_name** a factor with levels Raleigh-Durham-Cary, NC

**cbsa\_code** a numeric vector

**cbsa\_name** a factor with levels Durham, NC

**state\_code** a numeric vector

**state** a factor with levels North Carolina

**county\_code** a numeric vector

**county** a factor with levels Durham

**site\_latitude** a numeric vector

**site\_longitude** a numeric vector

possum	<i>possum</i>
--------	---------------

---

**Description**

Data representing possums in Australia and New Guinea. This is a copy of the data set by the same name in the DAAG package, however, the data set included here includes fewer variables.

**Usage**

```
possum
```

**Format**

A data frame with 104 observations on the following 8 variables.

**site** The site number where the possum was trapped.

**pop** Population, either Vic (Victoria) or other (New South Wales or Queensland).

**sex** Gender, either m (male) or f (female).

**age** Age.

**head\_l** Head length, in mm.

**skull\_w** Skull width, in mm.

**total\_l** Total length, in cm.

**tail\_l** Tail length, in cm.

**Source**

Lindenmayer, D. B., Viggers, K. L., Cunningham, R. B., and Donnelly, C. F. 1995. Morphological variation among columns of the mountain brushtail possum, *Trichosurus caninus* Ogilby (Phalangeridae: Marsupiala). *Australian Journal of Zoology* 43: 449-458.

**Examples**

```
library(ggplot2)

 ppp\_201503

*US Poll on who it is better to raise taxes on*

---

**Description**

A poll of 691 people, with party affiliation collected, asked whether they think it's better to raise taxes on the rich or raise taxes on the poor.

**Usage**

```
ppp_201503
```

**Format**

A data frame with 691 observations on the following 2 variables.

**party** Political party affiliation.

**taxes** Support for who to raise taxes on.

**Source**

Public Policy Polling, Americans on College Degrees, Classic Literature, the Seasons, and More, data collected Feb 20-22, 2015.

**Examples**

```
library(ggplot2)

ggplot(ppp_201503, aes(x = party, fill = taxes)) +
  geom_bar(position = "fill") +
  labs(x = "Party", x = "Proportion", fill = "Taxes")
```

---

present

*Birth counts*

---

**Description**

An updated version of the historical Arbutnot dataset. Numbers of boys and girls born in the United States between 1940 and 2002.

**Usage**

```
present
```

**Format**

A data frame with 63 observations on the following 3 variables.

**year** Year.

**boys** Number of boys born.

**girls** Number of girls born.

**Source**

Mathews, T. J., and Brady E. Hamilton. "Trend analysis of the sex ratio at birth in the United States." National vital statistics reports 53.20 (2005): 1-17.

prison

*Prison isolation experiment*

---

**Description**

Subjects from Central Prison in Raleigh, NC, volunteered for an experiment involving an "isolation" experience. The goal of the experiment was to find a treatment that reduces subjects' psychopathic deviant T scores. This score measures a person's need for control or their rebellion against control, and it is part of a commonly used mental health test called the Minnesota Multiphasic Personality Inventory (MMPI) test.

**Usage**

```
prison
```

**Format**

A data frame with 14 observations on the following 6 variables.

**pre\_trt1** Pre-treatment 1.

**post\_trt1** Post-treatment 1.

**pre\_trt2** Pre-treatment 2.

**post\_trt2** Post-treatment 2.

**pre\_trt3** Pre-treatment 3.

**post\_trt3** Post-treatment 3.

**Source**

```

---

```
prius_mpg
```

*User reported fuel efficiency for 2017 Toyota Prius Prime*

---

**Description**

Fueleconomy.gov, the official US government source for fuel economy information, allows users to share gas mileage information on their vehicles. These data come from 19 users sharing gas mileage on their 2017 Toyota Prius Prime. Note that these data are user estimates and since the sources data cannot be verified, the accuracy of these estimates are not guaranteed.

**Usage**

```
prius_mpg
```

**Format**

A data frame with 19 observations on the following 10 variables.

**average\_mpg** Average mileage as estimated by the user.

**state** US State the user lives in.

**stop\_and\_go** Proportion of stop and go driving.

**highway** Proportion of highway driving.

**last\_updated** Date estimate was last updated.

**Source**

Fueleconomy.gov, <https://www.fueleconomy.gov/mpg/MPG.do?action=mpgData&vehicleID=38531&browser=true&details=on>, retrieved 2019-04-14.

prof\_evals

*Professor evaluations and beauty*

---

**Description**

Data set from a paper on professor evaluations and beauty scores.

**Usage**

```
prof_evals
```

**Format**

A data frame with 463 observations on the following 64 variables.

**tenured** Tenured indicator.

**profnumber** Professor number.

**minority** Minority.

**age** Age.

**beautyf2upper** A numeric vector.

**beautyflowerdiv** A numeric vector.

**beautyfupperdiv** A numeric vector.

**beautym2upper** A numeric vector.

**beautymlowerdiv** A numeric vector.

**beautymupperdiv** A numeric vector.

**btystdave** A numeric vector.

**btystdf2u** A numeric vector.

**btystdfi** A numeric vector.

**btystdfu** A numeric vector.

**btystdm2u** A numeric vector.  
**btystdml** A numeric vector.  
**btystdmu** A numeric vector.  
**class1** Class 1.  
**class2** Class 2.  
**class3** Class 3.  
**class4** Class 4.  
**class5** Class 5.  
**class6** Class 6.  
**class7** Class 7.  
**class8** Class 8.  
**class9** Class 9.  
**class10** Class 10.  
**class11** Class 11.  
**class12** Class 12.  
**class13** Class 13.

qqnormsim

*Generate simulated QQ plots*

---

### Description

Create a 3 x 3 grid of quantile-quantile plots, the first of which corresponds to the input data. The other eight plots arise from simulating random normal data with the same mean, standard deviation, and length as the data. For use in comparing known-normal qqplots to an observed qqplot to assess normality.

### Usage

```
qqnormsim(sample, data)
```

**Arguments**

`sample` the variable to be plotted.  
`data` data frame to use.

**Value**

A 3 x 3 grid of qqplots.

---

resume	<i>Which resume attributes drive job callbacks? (Race and gender under study.)</i>
--------	--

---

**Description**

This experiment data comes from a study that sought to understand the influence of race and gender on job application callback rates. The study monitored job postings in Boston and Chicago for several months during 2001 and 2002 and used this to build up a set of test cases. Over this time period, the researchers randomly generating resumes to go out to a job posting, such as years of experience and education details, to create a realistic-looking resume. They then randomly assigned a name to the resume that would communicate the applicant's gender and race. The first names chosen for the study were selected so that the names would predominantly be recognized as belonging to black or white individuals. For example, Lakisha was a name that their survey indicated would be interpreted as a black woman, while Greg was a name that would generally be interpreted to be associated with a white male.

**Usage**

resume

**Format**

A data frame with 4870 observations, representing 4870 resumes, over 30 different variables that describe the job details, the outcome (`received_callback`), and attributes of the resume.

**job\_ad\_id** Unique ID associated with the advertisement.

**job\_city** City where the job was located.

**job\_industry** Industry of the job.

**job\_type** Type of role.

**job\_fed\_contractor** Indicator for if the employer is a federal contractor.

**job\_equal\_opp\_employer** Indicator for if the employer is an Equal Opportunity Employer.

**job\_ownership** The type of company, e.g. a nonprofit or a private company.

**job\_req\_any** Indicator for if any job requirements are listed. If so, the other `job_req_*` fields give more detail.

**job\_req\_communication** Indicator for if communication skills are required.

- job\_req\_education** Indicator for if some level of education is required.
- job\_req\_min\_experience** Amount of experience required.
- job\_req\_computer** Indicator for if computer skills are required.
- job\_req\_organization** Indicator for if organization skills are required.
- job\_req\_school** Level of education required.
- received\_callback** Indicator for if there was a callback from the job posting for the person listed on this resume.
- firstname** The first name used on the resume.
- race** Inferred race associated with the first name on the resume.
- gender** Inferred gender associated with the first name on the resume.
- years\_college** Years of college education listed on the resume.
- college\_degree** Indicator for if the resume listed a college degree.
- honors** Indicator for if the resume listed that the candidate has been awarded some honors.
- worked\_during\_school** Indicator for if the resume listed working while in school.
- years\_experience** Years of experience listed on the resume.
- computer\_skills** Indicator for if computer skills were listed on the resume. These skills were adapted for listings, though the skills were assigned independently of other details on the resume.
- special\_skills** Indicator for if any special skills were listed on the resume.
- volunteer** Indicator for if volunteering was listed on the resume.
- military** Indicator for if military experience was listed on the resume.
- employment\_holes** Indicator for if there were holes in the person's employment history.
- has\_email\_address** Indicator for if the resume lists an email address.
- resume\_quality** Each resume was generally classified as either lower or higher quality.

## Details

Because this is an experiment, where the race and gender attributes are being randomly assigned to the resumes, we can conclude that any statistically significant difference in callback rates is causally linked to these attributes.

Do you think it's reasonable to make a causal conclusion? You may have some health skepticism. However, do take care to appreciate that this was an experiment: the first name (and so the inferred race and gender) were randomly assigned to the resumes, and the quality and attributes of a resume were assigned independent of the race and gender. This means that any effects we observe are in fact causal, and the effects related to race are both statistically significant and very large: white applicants had about a 50% better chance of getting a callback than black candidates.

Do you still have doubts lingering in the back of your mind about the validity of this study? Maybe a counterargument about why the standard conclusions from this study may not apply? The article summarizing the results was exceptionally well-written, and it addresses many potential concerns about the study's approach. So if you're feeling skeptical about the conclusions, please find the link below and explore!

```
head(resume, 5)

# Some checks to confirm balance between race and
# other attributes of a resume. There should be
# some minor differences due to randomness, but
# each variable should be (and is) generally
# well-balanced.
table(resume$race, resume$years_college)
table(resume$race, resume$college_degree)
table(resume$race, resume$honors)
table(resume$race, resume$worked_during_school)
table(resume$race, resume$years_experience)
table(resume$race, resume$computer_skills)
table(resume$race, resume$special_skills)
table(resume$race, resume$volunteer)
table(resume$race, resume$military)
table(resume$race, resume$employment_holes)
table(resume$race, resume$has_email_address)
table(resume$race, resume$resume_quality)

# Regarding the callback outcome for race,
# we observe a very large difference.
tapply(
  resume$received_callback,
  resume[c("race", "gender")],
  mean)

# Natural question: is this statistically significant?
# A proper analysis would take into account the
# paired nature of the data. For each ad, let's
# compute the following statistic:
#   <callback rate for white candidates>
#   - <callback rate for black candidates>
# First construct the callbacks for white and
# black candidates by ad ID:
table(resume$race)
cb_white <- with(
  subset(resume, race == "white"),
  tapply(received_callback, job_ad_id, mean))
cb_black <- with(
```

```
subset(resume, race == "black"),
  tapply(received_callback, job_ad_id, mean))
# Next, compute the differences, where the
# names(cb_white) part ensures we matched up the
# job ad IDs.
diff <- cb_white - cb_black[names(cb_white)]
# Finally, we can apply a t-test on the differences:
t.test(diff)
# There is very strong evidence of an effect.

# Here's a similar check with gender. There are
# more female-inferred candidates used on the resumes.
table(resume$gender)
cb_male <- with(
  subset(resume, gender == "m"),
  tapply(received_callback, job_ad_id, mean))
cb_female <- with(
  subset(resume, gender == "f"),
  tapply(received_callback, job_ad_id, mean))
diff <- cb_female - cb_male[names(cb_female)]
# The `na.rm = TRUE` part ensures we limit to jobs
# where both a male and female resume were sent.
t.test(diff, na.rm = TRUE)
# There is no statistically significant difference.

# Was that the best analysis? Absolutely not!
# However, the analysis was unbiased. To get more
# precision on the estimates, we could build a
# multivariate model that includes many characteristics
# of the resumes sent, e.g. years of experience.
# Since those other characteristics were assigned
# independently of the race characteristics, this
# means the race finding will almost certainly will
# hold. However, it is possible that we'll find
# more interesting results with the gender investigation.

res\_demo\_1

*Simulated data for regression*

---

## Description

Simulated data for regression

## Usage

res\_demo\_1

**Format**

A data frame with 100 observations on the following 3 variables.

**x** a numeric vector

**y\_lin** a numeric vector

**y\_fan\_back** a numeric vector

**Examples**

```
res_demo_1
```

---

res_demo_2	<i>Simulated data for regression</i>
------------	--------------------------------------

---

**Description**

Simulated data for regression

**Usage**

```
res_demo_2
```

**Format**

A data frame with 300 observations on the following 3 variables.

**x** a numeric vector

**y\_fan** a numeric vector

**y\_log** a numeric vector

**Examples**

```

---

rosling\_responses      *Sample Responses to Two Public Health Questions*

---

### Description

Public health has improved and evolved, but has the public's knowledge changed with it? This data set explores sample responses for two survey questions posed by Hans Rosling during lectures to a wide array of well-educated audiences.

### Usage

```
rosling_responses
```

### Format

A data frame with 278 rows and 3 variables:

**question** ID for the question being posed.

**response** Noting whether the response was correct or incorrect.

**prob\_random\_correct** The probability the person would have guessed the answer correctly if they were guessing completely randomly.

### Source

The samples we describe are plausible based on the exact rates observed in larger samples. For more info on the actual rates observed, visit <https://www.gapminder.org>.

Another relevant reference is a book by Hans Rosling, Anna Rosling Ronnlund, and Ola Rosling called [Factfulness](#).

### Examples

```
frac_correct <- tapply(
  rosling_responses$response == "correct",
  rosling_responses$question,
  mean
)
frac_correct
n <- table(rosling_responses$question)
n
expected <- tapply(
  rosling_responses$prob_random_correct,
  rosling_responses$question,
  mean
)

# Construct confidence intervals.
se <- sqrt(frac_correct * (1 - frac_correct) / n)
```

```
# Lower bounds.  
frac_correct - 1.96 * se  
# Upper bounds.  
frac_correct + 1.96 * se  
  
# Construct Z-scores and p-values.  
z <- (frac_correct - expected) / se  
pt(z, df = n - 1)
```

---

russian\_influence\_on\_us\_election\_2016

*Russians' Opinions on US Election Influence in 2016*

---

## Description

Survey of Russian citizens on whether they believed their government tried to influence the 2016 US election. The survey was taken in Spring 2018 by Pew Research.

## Usage

```
russian_influence_on_us_election_2016
```

## Format

A data frame with 506 observations on the following variable.

**influence\_2016** Response of the Russian survey participant to the question of whether their government tried to influence the 2016 election in the United States.

## Details

The actual sample size was 1000. However, the original data were not from a simple random sample; after accounting for the design, the equivalent sample size was 506, which was what was used for the data set here to keep things simpler for intro stat analyses.

## Source

<https://www.pewresearch.org/global/2018/08/21/russians-say-their-government-did-not-try-to-influenc>

table(russian_influence_on_us_election_2016)
```

---

satgpa

*SAT and GPA data*

---

### Description

SAT and GPA data for 1000 students at an unnamed college.

### Usage

```
satgpa
```

### Format

A data frame with 1000 observations on the following 6 variables.

**sex** Gender of the student.

**sat\_v** Verbal SAT percentile.

**sat\_m** Math SAT percentile.

**sat\_sum** Total of verbal and math SAT percentiles.

**hs\_gpa** High school grade point average.

**fy\_gpa** First year (college) grade point average.

### Source

Educational Testing Service originally collected the data.

### References

<https://www.dartmouth.edu/~chance/course/Syllabi/Princeton96/Class12.html>

### Examples

```
library(ggplot2)
library(broom)

# Verbal scores
ggplot(satgpa, aes(x = sat_v, fy_gpa)) +
  geom_point() +
  geom_smooth(method = "lm") +
  labs(
    x = "Verbal SAT percentile",
    y = "First year (college) grade point average"
  )

mod <- lm(fy_gpa ~ sat_v, data = satgpa)
tidy(mod)
```

```
# Math scores
ggplot(satgpa, aes(x = sat_m, fy_gpa)) +
  geom_point() +
  geom_smooth(method = "lm") +
  labs(
    x = "Math SAT percentile",
    y = "First year (college) grade point average"
  )

mod <- lm(fy_gpa ~ sat_m, data = satgpa)
tidy(mod)
```

---

sat\_improve                      *Simulated data for SAT score improvement*

---

### Description

Fake data for score improvements from students who took a course from an SAT score improvement company.

### Usage

```
sat_improve
```

### Format

A data frame with 30 observations on the following variable.

**sat\_improve** a numeric vector

### Examples

```
sat_improve
```

---

scotus\_healthcare                      *Public Opinion with SCOTUS ruling on American Healthcare Act*

---

### Description

On June 28, 2012 the U.S. Supreme Court upheld the much debated 2010 healthcare law, declaring it constitutional. A Gallup poll released the day after this decision indicates that 46 decision.

### Usage

```
scotus_healthcare
```

**Format**

A data frame with 1012 observations on the following variable.

**response** Response values reported are agree and other.

**Source**

Gallup, Americans Issue Split Decision on Healthcare Ruling, retrieved 2012-06-28.

**Examples**

```
table(scotus_healthcare)
```

---

seattlepets	<i>Names of pets in Seattle</i>
-------------	---------------------------------

---

**Description**

Names of registered pets in Seattle, WA, between 2003 and 2018, provided by the city's Open Data Portal.

**Usage**

```
seattlepets
```

**Format**

A data frame with 52,519 rows and 7 variables:

**license\_issue\_date** Date the animal was registered with Seattle

**license\_number** Unique license number

**animal\_name** Animal's name

**species** Animal's species (dog, cat, goat, etc.)

**primary\_breed** Primary breed of the animal

**secondary\_breed** Secondary breed if mixed

**zip\_code** Zip code animal is registered in

**Source**

These data come from Seattle's Open Data Portal, <https://data.seattle.gov/Community/Seattle-Pet-Licenses/jguv-t9rb>

---

simulated_dist	<i>Simulated data sets, not necessarily drawn from a normal distribution.</i>
----------------	---

---

**Description**

Data were simulated in R, and some of the simulations do not represent data from actual normal distributions.

**Usage**

```
simulated_dist
```

**Format**

The format is: List of 4 \$ d1: data set of 100 observations. \$ d2: data set of 50 observations. \$ d3: num data set of 500 observations. \$ d4: data set of 15 observations. \$ d5: num data set of 25 observations. \$ d6: data set of 50 observations.

**Examples**

```
data(simulated_dist)
par(mfrow = c(3, 2))
lapply(simulated_dist, qqnorm)
```

---

simulated_normal	<i>Simulated data sets, drawn from a normal distribution.</i>
------------------	---

---

**Description**

Data were simulated using [rnorm](#).

**Usage**

```
simulated_normal
```

**Format**

The format is: List of 3 \$ n40 : 40 observations from a standard normal distribution. \$ n100: 100 observations from a standard normal distribution. \$ n400: 400 observations from a standard normal distribution.

## Examples

```
data(simulated_normal)
par(mfrow = c(1, 3))
lapply(simulated_normal, qqnorm)
```

---

simulated_scatter	<i>Simulated data for sample scatterplots</i>
-------------------	---

---

## Description

Fake data.

## Usage

```
simulated_scatter
```

## Format

A data frame with 500 observations on the following 3 variables.

**group** Group, representing data for a specific plot.

**x** x-value.

**y** y-value.

## Examples

```
library(ggplot2)

ggplot(simulated_scatter, aes(x = x, y = y)) +
  geom_point() +
  facet_wrap(~group)
```

---

 sinusitis

*Sinusitis and antibiotic experiment*

---

**Description**

Researchers studying the effect of antibiotic treatment for acute sinusitis to one of two groups: treatment or control.

**Usage**

sinusitis

**Format**

A data frame with 166 observations on the following 2 variables.

**group** a factor with levels control and treatment

**self\_reported\_improvement** a factor with levels no and yes

**Source**

J.M. Garbutt et al. Amoxicillin for Acute Rhinosinusitis: A Randomized Controlled Trial. In: JAMA: The Journal of the American Medical Association 307.7 (2012), pp. 685-692.

```

---

smallpox

*Smallpox vaccine results*

---

**Description**

A sample of 6,224 individuals from the year 1721 who were exposed to smallpox in Boston. Some of them had received a vaccine (inoculated) while others had not. Doctors at the time believed that inoculation, which involves exposing a person to the disease in a controlled form, could reduce the likelihood of death.

**Usage**

```
smallpox
```

**Format**

A data frame with 6224 observations on the following 2 variables.

**result** Whether the person 'died' or 'lived'.

**inoculated** Whether the person received inoculated.

**Source**

Fenner F. 1988. Smallpox and Its Eradication (History of International Public Health, No. 6). Geneva: World Health Organization. ISBN 92-4-156110-6.

**Examples**

data(smallpox)
table(smallpox)
```

---

smoking

*UK Smoking Data*

---

### Description

Survey data on smoking habits from the UK. The data set can be used for analyzing the demographic characteristics of smokers and types of tobacco consumed.

### Usage

smoking

### Format

A data frame with 1691 observations on the following 12 variables.

**gender** Gender with levels Female and Male.

**age** Age.

**marital\_status** Marital status with levels Divorced, Married, Separated, Single and Widowed.

**highest\_qualification** Highest education level with levels A Levels, Degree, GCSE/CSE, GCSE/O Level, Higher/Sub Degree, No Qualification, ONC/BTEC and Other/Sub Degree

**nationality** Nationality with levels British, English, Irish, Scottish, Welsh, Other, Refused and Unknown.

**ethnicity** Ethnicity with levels Asian, Black, Chinese, Mixed, White and Refused Unknown.

**gross\_income** Gross income with levels Under 2,600, 2,600 to 5,200, 5,200 to 10,400, 10,400 to 15,600, 15,600 to 20,800, 20,800 to 28,600, 28,600 to 36,400, Above 36,400, Refused and Unknown.

**region** Region with levels London, Midlands & East Anglia, Scotland, South East, South West, The North and Wales

**smoke** Smoking status with levels No and Yes

**amt\_weekends** Number of cigarettes smoked per day on weekends.

**amt\_weekdays** Number of cigarettes smoked per day on weekdays.

**type** Type of cigarettes smoked with levels Packets, Hand-Rolled, Both/Mainly Packets and Both/Mainly Hand-Rolled

### Source

National STEM Centre, Large Datasets from stats4schools, <https://www.stem.org.uk/resources/elibrary/resource/28452/large-datasets-stats4schools>.

## Examples

```
library(ggplot2)

ggplot(smoking, aes(x = amt_weekends)) +
  geom_histogram(binwidth = 5)

ggplot(smoking, aes(x = amt_weekdays)) +
  geom_histogram(binwidth = 5)

ggplot(smoking, aes(x = gender, fill = smoke)) +
  geom_bar(position = "fill")

ggplot(smoking, aes(x = marital_status, fill = smoke)) +
  geom_bar(position = "fill")
```

---

socialexp

*Social experiment*

---

## Description

A "social experiment" conducted by a TV program questioned what people do when they see a very obviously bruised woman getting picked on by her boyfriend. On two different occasions at the same restaurant, the same couple was depicted. In one scenario the woman was dressed "provocatively" and in the other scenario the woman was dressed "conservatively". The table below shows how many restaurant diners were present under each scenario, and whether or not they intervened.

## Usage

```
socialexp
```

## Format

A data frame with 45 observations on the following 2 variables.

**intervene** Whether other diners intervened or not.

**scenario** How the woman was dressed.

## Examples

```
table(socialexp)
```

---

solar

*Energy Output From Two Solar Arrays in San Francisco*

---

### Description

The data provide the energy output for several months from two roof-top solar arrays in San Francisco. This city is known for having highly variable weather, so while these two arrays are only about 1 mile apart from each other, the Inner Sunset location tends to have more fog.

### Usage

```
solar
```

### Format

A data frame with 284 observations on the following 3 variables. Each row represents a single day for one of the arrays.

**location** Location for the array.

**date** Date.

**kwh** Number of kWh

### Details

The Haight-Ashbury array is a 10.4 kWh array, while the Inner Sunset array is a 2.8 kWh array. The kWh units represents kilowatt-hours, which is the unit of energy that typically is used for electricity bills. The cost per kWh in San Francisco was about \$0.25 in 2016.

### Source

These data were provided by Larry Rosenfeld, a resident in San Francisco.

### Examples

```
solar.is <- subset(solar, location == "Inner_Sunset")
solar.ha <- subset(solar, location == "Haight_Ashbury")
plot(solar.is$date, solar.is$kwh, type = "l", ylim = c(0, max(solar$kwh)))
lines(solar.ha$date, solar.ha$kwh, col = 4)

d <- merge(solar.ha, solar.is, by = "date")
plot(d$date, d$kwh.x / d$kwh.y, type = "l")
```

---

`sp500`*Financial information for 50 S&P 500 companies*

---

**Description**

Fifty companies were randomly sampled from the 500 companies in the S&P 500, and their financial information was collected on March 8, 2012.

**Usage**`sp500`**Format**

A data frame with 50 observations on the following 12 variables.

**market\_cap** Total value of all company shares, in millions of dollars.

**stock** The name of the stock (e.g. AAPL for Apple).

**ent\_value** Enterprise value, which is an alternative to market cap that also accounts for things like cash and debt, in millions of dollars.

**trail\_pe** The market cap divided by the earnings (profits) over the last year.

**forward\_pe** The market cap divided by the forecasted earnings (profits) over the next year.

**ev\_over\_rev** Enterprise value divided by the company's revenue.

**profit\_margin** Percent of earnings that are profits.

**revenue** Revenue, in millions of dollars.

**growth** Quarterly revenue growth (year over year), in millions of dollars.

**earn\_before** Earnings before interest, taxes, depreciation, and amortization, in millions of dollars.

**cash** Total cash, in millions of dollars.

**debt** Total debt, in millions of dollars.

**Source**

Yahoo! Finance, retrieved 2012-03-08.

**Examples**

```
library(ggplot2)

ggplot(sp500, aes(x = ent_value, y = earn_before)) +
  geom_point() +
  labs(x = "Enterprise value", y = "Earnings")

ggplot(sp500, aes(x = ev_over_rev, y = forward_pe)) +
  geom_point() +
```

```

labs(x = "Enterprise value / revenue, logged",
      y = "Market cap / forecasted earnings, logged")

ggplot(sp500, aes(x = ent_value, y = earn_before)) +
  geom_point() +
  scale_x_log10() +
  scale_y_log10() +
  labs(x = "Enterprise value", y = "Earnings")

ggplot(sp500, aes(x = ev_over_rev, y = forward_pe)) +
  geom_point() +
  scale_x_log10() +
  scale_y_log10() +
  labs(x = "Enterprise value / revenue, logged",
        y = "Market cap / forecasted earnings, logged")

```

---

sp500\_1950\_2018

*Daily observations for the S&P 500*

---

### Description

Data runs from 1950 to near the end of 2018.

### Usage

```
sp500_1950_2018
```

### Format

A data frame with 17346 observations on the following 7 variables.

**Date** Date of the form "YYYY-MM-DD".

**Open** Opening price.

**High** Highest price of the day.

**Low** Lowest price of the day.

**Close** Closing price of the day.

**Adj.Close** Adjusted price at close after accounting for dividends paid out.

**Volume** Trading volume.

### Source

Yahoo! Finance

## Examples

```
data(sp500_1950_2018)
sp500.ten.years <- subset(sp500_1950_2018,
  "2009-01-01" <= as.Date(Date) & as.Date(Date) <= "2018-12-31")
d <- diff(sp500.ten.years$Adj.Close)
mean(d > 0)
```

---

sp500\_seq

*S&P 500 stock data*

---

## Description

Daily stock returns from the S&P500 for 1990-2011 can be used to assess whether stock activity each day is independent of the stock's behavior on previous days. We label each day as Up or Down (D) depending on whether the market was up or down that day. For example, consider the following changes in price, their new labels of up and down, and then the number of days that must be observed before each Up day.

## Usage

```
sp500_seq
```

## Format

A data frame with 2948 observations on the following variable.

**race** a factor with levels 1, 2, 3, 4, 5, 6, and 7+

## Source

<http://www.google.com/finance>

## Examples

```
sp500_seq
```

---

speed\_gender\_height     *Speed, gender, and height of 1325 students*

---

**Description**

1,325 UCLA students were asked to fill out a survey where they were asked about their height, fastest speed they have ever driven, and gender.

**Usage**

```
speed_gender_height
```

**Format**

A data frame with 1325 observations on the following 3 variables.

**speed** a numeric vector

**gender** a factor with levels female and male

**height** a numeric vector

**Examples**

```
speed_gender_height
```

---

starbucks     *Starbucks nutrition*

---

**Description**

Nutrition facts for several Starbucks food items

**Usage**

```
starbucks
```

**Format**

A data frame with 77 observations on the following 7 variables.

**item** Food item.

**calories** Calories.

**fat** a numeric vector

**carb** a numeric vector

**fiber** a numeric vector

**protein** a numeric vector

**type** a factor with levels bakery, bistro box, hot breakfast, parfait, petite, salad, and sandwich

stats\_scores

*Final exam scores for twenty students*

---

### Description

Scores range from 57 to 94.

### Usage

```
stats_scores
```

### Format

A data frame with 20 observations on the following variable.

**scores** a numeric vector

### Examples

```
stats_scores
```

---

`stem_cell`*Embryonic stem cells to treat heart attack (in sheep)*

---

**Description**

Does treatment using embryonic stem cells (ESCs) help improve heart function following a heart attack? Each sheep in the study was randomly assigned to the ESC or control group, and the change in their hearts' pumping capacity was measured in the study. A positive value corresponds to increased pumping capacity, which generally suggests a stronger recovery.

**Usage**`stem_cell`**Format**

A data frame with 18 observations on the following 3 variables.

**trmt** a factor with levels `ctrl` `esc`

**before** a numeric vector

**after** a numeric vector

`stent30`*Stents for the treatment of stroke*

---

**Description**

An experiment that studies effectiveness of stents in treating patients at risk of stroke with some unexpected results. 'stent30' represents the results 30 days after stroke and 'stent365' represents the results 365 days after stroke.

**Usage**`stent30`

**Format**

A data frame with 451 observations on the following 2 variables.

**group** a factor with levels control and treatment

**outcome** a factor with levels no event and stroke

**Source**

Chimowitz MI, Lynn MJ, Derdeyn CP, et al. 2011. Stenting versus Aggressive Medical Therapy for Intracranial Arterial Stenosis. *New England Journal of Medicine* 365:993- 1003. <https://www.nejm.org/doi/full/10.1056/NEJMoa1105335>. table(stent30)
```

```
# 365-day results
table(stent365)
```

---

stocks\_18

*Monthly Returns for a few stocks*

---

**Description**

Monthly return data for a few stocks, which covers stock prices from November 2015 through October 2018.

**Usage**

```
stocks_18
```

**Format**

A data frame with 36 observations on the following 3 variables.

**date** First day of the month corresponding to the returns.

**goog** Google stock price change.

**cat** Caterpillar stock price change.

**xom** Exxon Mobil stock price change.

**Source**

Yahoo! Finance, direct download.

## Examples

```
d <- stocks_18
dim(d)
apply(d[, 2:3], 2, mean)
apply(d[, 2:3], 2, sd)
```

---

student_housing	<i>Community college housing (simulated data, 2015)</i>
-----------------	---

---

## Description

These are simulated data and intended to represent housing prices of students at a college.

## Usage

```
student_housing
```

## Format

A data frame with 175 observations on the following variable.

**price** Monthly housing price, simulated.

## Examples

```
set.seed(5)
generate_student_housing<- data.frame(
  price = round(rnorm(175, 515, 65) + exp(rnorm(175, 4.2, 1))))
hist(student_housing$price, 20)
t.test(student_housing$price)
mean(student_housing$price)
sd(student_housing$price)
identical(student_housing, generate_student_housing)
```

---

student_sleep	<i>Sleep for 110 students (simulated)</i>
---------------	---

---

**Description**

A simulated data set for how much 110 college students each slept in a single night.

**Usage**

```
student_sleep
```

**Format**

A data frame with 110 observations on the following variable.

**hours** Number of hours slept by this student (simulated).

**Source**

Simulated data.

**Examples**

```
set.seed(2)
x <- exp(c(rnorm(100, log(7.5), 0.15),
           rnorm(10, log(10), 0.196)))
x <- round(x - mean(x) + 7.42, 2)

identical(x, student_sleep$hours)
```

---

sulphinpyrazone	<i>Treating heart attacks</i>
-----------------	-------------------------------

---

**Description**

Experiment data for studying the efficacy of treating patients who have had a heart attack with Sulphinpyrazone.

**Usage**

```
sulphinpyrazone
```

**Format**

A data frame with 1475 observations on the following 2 variables.

**group** a factor with levels control treatment

**outcome** a factor with levels died lived

**Source**

Anturane Reinfarction Trial Research Group. 1980. Sulfapyrazone in the prevention of sudden death after myocardial infarction. *New England Journal of Medicine* 302(5):250-256.

**Examples**

---

teacher

*Teacher Salaries in St. Louis, Michigan*

---

### Description

This data set contains teacher salaries from 2009-2010 for 71 teachers employed by the St. Louis Public School in Michigan, as well as several covariates.

### Usage

```
teacher
```

### Format

A data frame with 71 observations on the following 8 variables.

**id** Identification code for each teacher, assigned randomly.

**degree** Highest educational degree attained: BA (bachelor's degree) or MA (master's degree).

**fte** Full-time enrollment status: full-time 1 or part-time 0.5.

**years** Number of years employed by the school district.

**base** Base annual salary, in dollars.

**fica** Amount paid into Social Security and Medicare per year through the Federal Insurance Contribution Act (FICA), in dollars.

**retirement** Amount paid into the retirement fund of the teacher per year, in dollars.

**total** Total annual salary of the teacher, resulting from the sum of base salary + fica + retirement, in dollars.

### Source

Originally posted on <https://dev.socrata.com/data>, removed in 2020.

### Examples

```
library(ggplot2)

# Salary and education level
ggplot(teacher, aes(x = degree, y = base)) +
  geom_boxplot() +
  labs(x = "Highest educational degree attained",
       y = "Base annual salary, in $",
       color = "Degree",
       title = "Salary and education level")

# Salary and years of employment
ggplot(teacher, aes(x = years, y = base, color = degree)) +
  geom_point() +
```

```
labs(x = "Number of years employed by the school district",  
     y = "Base annual salary, in $",  
     color = "Degree",  
     title = "Salary and years of employment")
```

---

textbooks

*Textbook data for UCLA Bookstore and Amazon*

---

### Description

A random sample was taken of nearly 10% of UCLA courses. The most expensive textbook for each course was identified, and its new price at the UCLA Bookstore and on Amazon.com were recorded.

### Usage

textbooks

### Format

A data frame with 73 observations on the following 7 variables.

**dept\_abbr** Course department (abbreviated).

**course** Course number.

**isbn** Book ISBN.

**ucla\_new** New price at the UCLA Bookstore.

**amaz\_new** New price on Amazon.com.

**more** Whether additional books were required for the course (Y means "yes, additional books were required").

**diff** The UCLA Bookstore price minus the Amazon.com price for each book.

### Details

The sample represents only courses where textbooks were listed online through UCLA Bookstore's website. The most expensive textbook was selected based on the UCLA Bookstore price, which may insert bias into the data; for this reason, it may be beneficial to analyze only the data where more is "N".

### Source

Collected by David Diez.

**Examples**

```
library(ggplot2)

ggplot(textbooks, aes(x = diff)) +
  geom_histogram(binwidth = 5)

t.test(textbooks$diff)
```

---

thanksgiving_spend	<i>Thanksgiving spending, simulated based on Gallup poll.</i>
--------------------	---

---

**Description**

This entry gives simulated spending data for Americans during Thanksgiving in 2009 based on findings of a Gallup poll.

**Usage**

```
thanksgiving_spend
```

**Format**

A data frame with 436 observations on the following 1 variable.

**spending** Amount of spending, in US dollars.

**Examples**

```
library(ggplot2)

ggplot(thanksgiving_spend, aes(x = spending)) +
  geom_histogram(binwidth = 20)
```

---

tips	<i>Tip data</i>
------	-----------------

---

**Description**

A simulated data set of tips over a few weeks on a couple days per week. Each tip is associated with a single group, which may include several bills and tables (i.e. groups paid in one lump sum in simulations).

**Usage**

tips

**Format**

A data frame with 95 observations on the following 5 variables.

**week** Week number.

**day** Day, either Friday or Tuesday.

**n\_peop** Number of people associated with the group.

**bill** Total bill for the group.

**tip** Total tip from the group.

**Details**

This data set was built using simulations of tables, then bills, then tips based on the bills. Large groups were assumed to only pay the gratuity, which is evident in the data. Tips were set to be plausible round values; they were often (but not always) rounded to dollars, quarters, etc.

**Source**

Simulated data set.

**Examples**

```
library(ggplot2)

ggplot(tips, aes(x = day, y = tip)) +
  geom_boxplot()

ggplot(tips, aes(x = tip, fill = factor(week))) +
  geom_density(alpha = 0.5) +
  labs(x = "Tip", y = "Density", fill = "Week")

ggplot(tips, aes(x = tip)) +
  geom_dotplot()

ggplot(tips, aes(x = tip, fill = factor(day))) +
  geom_density(alpha = 0.5) +
  labs(x = "Tip", y = "Density", fill = "Day")
```

---

toohey	<i>Simulated polling data set</i>
--------	-----------------------------------

---

**Description**

Simulated data for a fake political candidate.

**Usage**

toohey

**Format**

A data frame with 500 observations on the following variable.

**vote\_for** a factor with levels no yes

**Examples**

toohey

---

tourism	<i>Turkey tourism</i>
---------	-----------------------

---

**Description**

Summary of tourism in Turkey.

**Usage**

tourism

**Format**

A data frame with 47 observations on the following 3 variables.

**year** a numeric vector

**visitor\_count\_tho** a numeric vector

**tourist\_spending** a numeric vector

**Source**

Association of Turkish Travel Agencies, Foreign Visitors Figure & Tourist Spendings By Years.

[http://www.tursab.org.tr/en/statistics/foreign-visitors-figure-tourist-spendings-by-years\\_1083.html](http://www.tursab.org.tr/en/statistics/foreign-visitors-figure-tourist-spendings-by-years_1083.html)

**Examples**

tourism

---

toy\_anova

*Simulated data set for ANOVA*

---

**Description**

Simulated data set for getting a better understanding of intuition that ANOVA is based off of.

**Usage**

toy\_anova

**Format**

A data frame with 70 observations on the following 3 variables.

**group** a factor with levels I II III

**outcome** a numeric vector

**Examples**

toy\_anova

---

transplant

*Transplant consultant success rate (fake data)*

---

**Description**

Summarizing whether there was or was not a complication for 62 patients who used a particular medical consultant.

**Usage**

transplant

**Format**

A data frame with 62 observations on the following variable.

**outcome** a factor with levels complications okay

**Examples**

```
transplant
```

---

```
treeDiag
```

---

```
Construct tree diagrams
```

---

**Description**

Construct beautiful tree diagrams

**Usage**

```
treeDiag(
  main,
  p1,
  p2,
  out1 = c("Yes", "No"),
  out2 = c("Yes", "No"),
  textwd = 0.15,
  solwd = 0.2,
  SBS = c(TRUE, TRUE),
  showSol = TRUE,
  solSub = NULL,
  digits = 4,
  textadj = 0.015,
  cex.main = 1.3,
  col.main = "#999999",
  showWork = FALSE
)
```

**Arguments**

main	Character vector with two variable names, descriptions, or questions
p1	Vector of probabilities for the primary branches
p2	List for the secondary branches, where each list item should be a numerical vector of probabilities corresponding to the primary branches of p1
out1	Character vector of the outcomes corresponding to the primary branches
out2	Character vector of the outcomes corresponding to the secondary branches
textwd	The width provided for text with a default of 0.15
solwd	The with provided for the solution with a default of 0.2
SBS	A boolean vector indicating whether to place text and probability side-by-side for the primary and secondary branches

showSol	Boolean indicating whether to show the solution in the tree diagram
solSub	An optional list of vectors corresponding to p2 to list alternative text or solutions
digits	The number of digits to show in the solution
textadj	Vertical adjustment of text
cex.main	Size of main in the plot
col.main	Color of main in the plot
showWork	Whether work should be shown for the solutions

**Author(s)**

David Diez, Christopher Barr

**Examples**

```
treeDiag(c("Flight on time?", "Luggage on time?"),
         c(0.8, 0.2), list(c(0.97, 0.03), c(0.15, 0.85)))
treeDiag(c("Breakfast?", "Go to class"), c(.4, .6),
         list(c(0.4, 0.36, 0.34), c(0.6, 0.3, 0.1)), c("Yes", "No"),
         c("Statistics", "English", "Sociology"), showWork = TRUE)
treeDiag(c("Breakfast?", "Go to class"), c(0.4, 0.11, 0.49),
         list(c(0.4, 0.36, 0.24), c(0.6, 0.3, 0.1), c(0.1, 0.4, 0.5)),
         c("one", "two", "three"), c("Statistics", "English", "Sociology"))
treeDiag(c("Dow Jones rise?", "NASDAQ rise?"),
         c(0.53, 0.47), list(c(0.75, 0.25), c(0.72, 0.28)),
         solSub = list(c("a"), "b"), c("c"), "d"), solwd = 0.08)
```

---

ucla\_f18

*UCLA courses in Fall 2018*

---

**Description**

List of all courses at UCLA during Fall 2018.

**Usage**

ucla\_f18

**Format**

A data frame with 3950 observations on the following 14 variables.

**year** Year the course was offered  
**term** Term the course was offered  
**subject** Subject  
**subject\_abbr** Subject abbreviation, if any  
**course** Course name

**course\_num** Course number, complete  
**course\_numeric** Course number, numeric only  
**seminar** Boolean for if this is a seminar course  
**ind\_study** Boolean for if this is some form of independent study  
**apprenticeship** Boolean for if this is an apprenticeship  
**internship** Boolean for if this is an internship  
**honors\_contracts** Boolean for if this is an honors contracts course  
**laboratory** Boolean for if this is a lab  
**special\_topic** Boolean for if this is any of the special types of courses listed

### Source

```

---

ucla\_textbooks\_f18      *Sample of UCLA course textbooks for Fall 2018*

---

### Description

A sample of courses were collected from UCLA from Fall 2018, and the corresponding textbook prices were collected from the UCLA bookstore and also from Amazon.

### Usage

```
ucla_textbooks_f18
```

**Format**

A data frame with 201 observations on the following 20 variables.

**year** Year the course was offered

**term** Term the course was offered

**subject** Subject

**subject\_abbrev** Subject abbreviation, if any

**course** Course name

**course\_num** Course number, complete

**course\_numeric** Course number, numeric only

**seminar** Boolean for if this is a seminar course.

**ind\_study** Boolean for if this is some form of independent study

**apprenticeship** Boolean for if this is an apprenticeship

**internship** Boolean for if this is an internship

**honors\_contracts** Boolean for if this is an honors contracts course

**laboratory** Boolean for if this is a lab

**special\_topic** Boolean for if this is any of the special types of courses listed

**textbook\_isbn** Textbook ISBN

**bookstore\_new** New price at the UCLA bookstore

**bookstore\_used** Used price at the UCLA bookstore

**amazon\_new** New price sold by Amazon

**amazon\_used** Used price sold by Amazon

**notes** Any relevant notes

**Details**

A past data set was collected from UCLA courses in Spring 2010, and Amazon at that time was found to be almost uniformly lower than those of the UCLA bookstore's. Now in 2018, the UCLA bookstore is about even with Amazon on the vast majority of titles, and there is no statistical difference in the sample data.

The most expensive book required for the course was generally used.

The reason why we advocate for using raw amount differences instead of percent differences is that a 20% savings on a \$10 book is minor relative to a 20% savings on a \$100 book, meaning a small and largely insignificant price difference on low-priced books would balance numerically (but not in a practical sense) a moderate but important price difference on more expensive books. So while this tends to result in a bit less sensitivity in detecting *some* effect, we believe the absolute difference compares prices in a more meaningful way.

Used prices contain the shipping cost but do not contain tax. The used prices are a more nuanced comparison, since these are all 3rd party sellers. Amazon is often more a marketplace than a retail site at this point, and many people buy from 3rd party sellers on Amazon now without realizing it. The relationship Amazon has with 3rd party sellers is also challenging. Given the frequently changing dynamics in this space, we don't think any analysis here will be very reliable for long

term insights since products from these sellers changes frequently in quantity and price. For this reason, we focus only on new books sold directly by Amazon in our comparison. In a future round of data collection, it may be interesting to explore whether the dynamics have changed in the used market.

### Examples

```
library(ggplot2)
library(dplyr)

ggplot(ucla_textbooks_f18, aes(x = bookstore_new, y = amazon_new)) +
  geom_point() +
  geom_abline(slope = 1, intercept = 0, color = "orange") +
  labs(x = "UCLA Bookstore price", y = "Amazon price",
       title = "Amazon vs. UCLA Bookstore prices of new textbooks",
       subtitle = "Orange line represents y = x")

# The following outliers were double checked for accuracy
ucla_textbooks_f18_with_diff <- ucla_textbooks_f18 %>%
  mutate(diff = bookstore_new - amazon_new)

ucla_textbooks_f18_with_diff %>%
  filter(diff > 20 | diff < -20)

# Distribution of price differences
ggplot(ucla_textbooks_f18_with_diff, aes(x = diff)) +
  geom_histogram(binwidth = 5)

# t-test of price differences
t.test(ucla_textbooks_f18_with_diff$diff)
```

### Description

This data set comes from the Guardian's Data Blog and includes five financial demographic variables.

**Usage**

ukdemo

**Format**

A data frame with 12 observations on the following 6 variables.

**region** Region in the United Kingdom

**debt** Average regional debt, not including mortgages, in pounds

**unemployment** Percent unemployment

**house** Average house price, in pounds

**pay** Average hourly pay, in pounds

**rpi** Retail price index, which is standardized to 100 for the entire UK, and lower index scores correspond to lower prices

**Source**

The data was described in the Guardian Data Blog: <https://www.theguardian.com/news/datablog/interactive/2011/oct/27/debt-money-expert-facts>, retrieved 2011-11-01.

**References**

Guardian Data Blog

**Examples**

```
library(ggplot2)

ggplot(ukdemo, aes(x = pay, y = rpi)) +
  geom_point() +
  labs(x = "Average hourly pay", y = "Retail price index")
```

---

unempl

*Annual unemployment since 1890*

---

**Description**

A compilation of two data sets that provides an estimate of unemployment from 1890 to 2010.

**Usage**

unempl

**Format**

A data frame with 121 observations on the following 3 variables.

**year** Year

**unemp** Unemployment rate, in percent

**us\_data** 1 if from the Bureau of Labor Statistics, 0 otherwise

**Source**

The data are from Wikipedia at the following URL accessed on November 1st, 2010:

[https://en.wikipedia.org/wiki/File:US\\_Unemployment\\_1890-2009.gif](https://en.wikipedia.org/wiki/File:US_Unemployment_1890-2009.gif)

Below is a direct quote from Wikipedia describing the sources of the data:

Own work by Peace01234 Complete raw data are on Peace01234. 1930-2009 data are from Bureau of Labor Statistics, Employment status of the civilian noninstitutional population, 1940 to date ftp://ftp.bls.gov/pub/special.requests/lf/aat1.txt, retrieved March 6, 2009 and retrieved February 12, 2010. Data prior to 1948 are for persons age 14 and over. Data beginning in 1948 are for persons age 16 and over. See also "Historical Comparability" under the Household Data section of the Explanatory Notes at [https://www.bls.gov/cps/eetech\\_methods.pdf](https://www.bls.gov/cps/eetech_methods.pdf). 1890-1930 data are from Christina Romer (1986). "Spurious Volatility in Historical Unemployment Data", The Journal of Political Economy, 94(1): 1-37. 1930-1940 data are from Robert M. Coen (1973). "Labor Force and Unemployment in the 1920's and 1930's: A Re-Examination Based on Postwar Experience", The Review of Economics and Statistics, 55(1): 46-55. Unemployment data was only surveyed once each decade until 1940 when yearly surveys were begun. The yearly data estimates before 1940 are based on the decade surveys combined with other relevant surveys that were collected during those years. The methods are described in detail by Coen and Romer.

unemploy_pres	<i>President's party performance and unemployment rate</i>
---------------	--

---

**Description**

Covers midterm elections.

**Usage**

unemploy\_pres

**Format**

A data frame with 29 observations on the following 5 variables.

**year** a numeric vector

**potus** The president in office.

**party** President's party.

**unemp** Unemployment rate.

**change** Change in House seats for the president's party.

**Source**

Wikipedia.

**Examples**

unemploy\_pres

---

winery_cars	<i>Time Between Gondola Cars at Sterling Winery</i>
-------------	---

---

**Description**

These times represent times between gondolas at Sterling Winery. The main take-away: there are 7 cars, as evidenced by the somewhat regular increases in splits between every 7 cars. The reason the times are slightly non-constant is that the gondolas come off the tracks, so times will change a little between each period.

**Usage**

winery\_cars

**Format**

A data frame with 52 observations on the following 2 variables.

**obs\_number** The observation number, e.g. observation 3 was immediately preceded by observation 2.

**time\_until\_next** Time until this gondola car arrived since the last car had left.

**Details**

Important context: there was a sufficient line that people were leaving the winery.

So why is this data valuable? It indicates that the winery should add one more car since it has a lot of time wasted every 7th car. By adding another car, fewer visitors are likely to be turned away, resulting in increased revenue.

**Source**

In-person data collection by David Diez (OpenIntro) on 2013-07-04.

**Examples**

```
winery_cars$car_number <- rep(1:7, 10)[1:nrow(winery_cars)]
col <- COL[ifelse(winery_cars$car_number == 3, 4, 1)]
plot(winery_cars[, c("obs_number", "time_until_next")],
     col = col, pch = 19)
plot(winery_cars$car_number, winery_cars$time_until_next,
     col = fadeColor(col, "88"), pch = 19)
```

---

### Description

An experiment conducted by the MythBusters, a science entertainment TV program on the Discovery Channel, tested if a person can be subconsciously influenced into yawning if another person near them yawns. 50 people were randomly assigned to two groups: 34 to a group where a person near them yawned (treatment) and 16 to a group where there wasn't a person yawning near them (control).

### Usage

```
yawn
```

### Format

A data frame with 50 observations on the following 2 variables.

**result** a factor with levels not yawn yawn

**group** a factor with levels ctrl trmt

### Source

MythBusters, Season 3, Episode 28.

### Examples

```
yawn
```

---

yrbss

*Youth Risk Behavior Surveillance System (YRBSS)*

---

### Description

Select variables from YRBSS.

### Usage

```
yrbss
```

### Format

A data frame with 13583 observations on the following 13 variables.

**age** Age, in years.

**gender** Gender.

**grade** School grade.

**hispanic** Hispanic or not.

**race** Race / ethnicity.

**height** Height, in meters (3.28 feet per meter).

**weight** Weight, in kilograms (2.2 pounds per kilogram).

**helmet\_12m** How often did you wear a helmet when biking in the last 12 months?

**text\_while\_driving\_30d** How many days did you text while driving in the last 30 days?

**physically\_active\_7d** How many days were you physically active for 60+ minutes in the last 7 days?

**hours\_tv\_per\_school\_day** How many hours of TV do you typically watch on a school night?

**strength\_training\_7d** How many days did you do strength training (e.g. lift weights) in the last 7 days?

**school\_night\_hours\_sleep** How many hours of sleep do you typically get on a school night?

### Source

CDC's Youth Risk Behavior Surveillance System (YRBSS)

### Examples

```
table(yrbss$physically_active_7d)
```

---

yrbss\_samp

*Sample of Youth Risk Behavior Surveillance System (YRBSS)*

---

### Description

A sample of the [yrbss](#) data set.

### Usage

```
yrbss_samp
```

### Format

A data frame with 100 observations on the following 13 variables.

**age** Age, in years.

**gender** Gender.

**grade** School grade.

**hispanic** Hispanic or not.

**race** Race / ethnicity.

**height** Height, in meters (3.28 feet per meter).

**weight** Weight, in kilograms (2.2 pounds per kilogram).

**helmet\_12m** How often did you wear a helmet when biking in the last 12 months?

**text\_while\_driving\_30d** How many days did you text while driving in the last 30 days?

**physically\_active\_7d** How many days were you physically active for 60+ minutes in the last 7 days?

**hours\_tv\_per\_school\_day** How many hours of TV do you typically watch on a school night?

**strength\_training\_7d** How many days did you do strength training (e.g. lift weights) in the last 7 days?

**school\_night\_hours\_sleep** How many hours of sleep do you typically get on a school night?
